Timed GPIO XTAL Clock Gate enable register.

Type	Size	Offset	Default
MMIO	32 bit	40301518h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>TGPIO_XTL(CG)_REG:</b> This clock needs to be gated before writing to the clk_sel register.

#### 14.3.2.268 Reg TGPIO\_PTP(CG)\_REG (TGPIO\_PTP(CG)\_REG) – Offset 4030151Ch

Timed GPIO PTP Clock Gate enable register.

Type	Size	Offset	Default
MMIO	32 bit	4030151Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>TGPIO_PPT(CG)_REG:</b> This clock needs to be gated before writing to the clk_sel register.

#### 14.3.2.269 REG TGPIO\_TS\_SEL\_0\_REG (TGPIO\_TS\_SEL\_0\_REG) — Offset 40301520h

TGPIO input timestamp select register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301520h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Timestamp Select 0 (TGPIO_TS_SEL_0_REG):</b> TGPIO input timestamp select register 0.

#### 14.3.2.270 REG TGPIO\_TS\_SEL\_1\_REG (TGPIO\_TS\_SEL\_1\_REG) — Offset 40301524h

TGPIO input timestamp select register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301524h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved
7:0	00h RW	<b>Timestamp Select 1 (TGPIO_TS_SEL_1_REG):</b> TGPIO input timestamp select register 1.

#### 14.3.2.271 REG TMT\_CLK\_SEL\_REG (TGPIO\_TMT\_CLK\_SEL\_REG) — Offset 40301528h

TMT clock select register.

Type	Size	Offset	Default
MMIO	32 bit	40301528h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	Reserved
2:0	0h RW	<b>TMT Clock Select (TGPIO_TMT_CLK_SEL_REG):</b> TMT clock select register.

#### 14.3.2.272 REG GPIO\_TSC\_CTL\_REG (TGPIO\_CTS\_ENABLE\_REG) — Offset 40301530h

TGPIO cross timestamp control register.

Type	Size	Offset	Default
MMIO	32 bit	40301530h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:4	0h RW	<b>TMT CTS En 2 (TMT_CTS_ENABLE_REG_2):</b> TMT Cross Time Stamp Control [2].
3:2	0h RW	<b>TMT CTS En 1 (TMT_CTS_ENABLE_REG_1):</b> TMT Cross Time Stamp Control [1].
1:0	0h RW	<b>TMT CTS En 0 (TMT_CTS_ENABLE_REG_0):</b> TMT Cross Time Stamp Control [0].

#### 14.3.2.273 REG\_TGPIO\_TSC\_STATUS\_REG (TGPIO\_CTS\_VALID\_REG) — Offset 40301534h

TGPIO cross timestamp status register.

Type	Size	Offset	Default
MMIO	32 bit	40301534h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:4	0h RO	<b>TMT CTS STATUS 2 (TMT_CTS_VALID_REG_2):</b> TMT Cross Time Stamp Status [2].
3:2	0h RO	<b>TMT CTS STATUS 1 (TMT_CTS_VALID_REG_1):</b> TMT Cross Time Stamp Status [1].
1:0	0h RO	<b>TMT CTS STATUS 0 (TMT_CTS_VALID_REG_0):</b> TMT Cross Time Stamp Status [0].

#### 14.3.2.274 REG\_TMTCTL\_TSG (TMT\_CTL\_TSG\_REG) — Offset 40301600h

TMT control register.

Type	Size	Offset	Default
MMIO	32 bit	40301600h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>TMT ENABLE (TGPI0_TMT_CTRL_TSG_REG):</b> Enables incrementing TMT when set Should be cleared before initializing TMT.

#### 14.3.2.275 REG TMTR\_TSG (TMTR\_TSG\_REG) — Offset 40301604h

TMT timestamp residue register.

Type	Size	Offset	Default
MMIO	32 bit	40301604h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>TGPI0_TMT_TMTR_TSG_REG:</b> TMT residue value defined with a resolution of 2^-32ns.

#### 14.3.2.276 REG TMTL\_TSG (TMTL\_TSG\_REG) — Offset 40301608h

TMT timestamp low register.

Type	Size	Offset	Default
MMIO	32 bit	40301608h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	<b>Reserved</b>
29:0	00000000h RW/V	<b>TGPIO_TMT_TMTH_TSG_REG:</b> Lower Half of the TMT defined in ns..

#### 14.3.2.277 REG TMTH\_TSG (TMTH\_TSG\_REG) — Offset 4030160Ch

TMT timestamp high register.

Type	Size	Offset	Default
MMIO	32 bit	4030160Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>TGPIO_TMT_TMTH_TSG_REG:</b> Upper Half of the TMT defined in ns..

#### 14.3.2.278 REG TIMINCA\_TSG (TMT\_TIMINCA\_TSG\_REG) — Offset 40301610h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	40301610h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>TGPIO_TMT_TSG_TIMINCA_ISIGN:</b> Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + IncValue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	<b>TGPIO_TMT_TSG_TIMINCA_INC_VALUE:</b> Increment Value to be added or subtracted from 5ns clock cycle.

#### 14.3.2.279 REG TIMADJ\_TSG (TMT\_TIMADJ\_TSG\_REG) – Offset 40301614h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	40301614h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>TGPIO_TMT_TSG_TIMADJ_SIGN:</b> 0 = positive 1 = Negative.
30	0h RW	<b>Zero Bit (TGPIO_TMT_TSG_TIMADJ_ZERO_BIT):</b> Zero bit.
29:0	00000000h RW	<b>TGPIO_TMT_TSG_TIMADJ_TADJUS:</b> Time Adjust Value.

#### 14.3.2.280 REG LXTS\_TMT\_HIGH\_TSG (TMT\_LXTS\_SNAPSHOT\_TSG\_REG\_1) – Offset 40301618h

TMT local cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301618h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_TMTH_TSG_REG:</b> TMTH captured when a local cross time stamp capture is enabled.

#### 14.3.2.281 REG LXTS\_TMT\_LOW\_TSG (TMT\_LXTS\_SNAPSHOT\_TSG\_REG\_0) – Offset 4030161Ch

TMT local cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	4030161Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_TMTL_TSG_REG:</b> TMTL captured when a local cross time stamp capture is enabled.

#### 14.3.2.282 REG LXTS\_ART\_HIGH\_TSG (TMT\_ART\_SNAPSHOT\_TSG\_REG\_1) – Offset 40301620h

TMT local cross timestamp ART snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301620h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_ART_HIGH_TSG_REG:</b> ART bits [63:0] captured when a local cross time stamp capture is enabled.

#### 14.3.2.283 REG LXTS\_ART\_LOW\_TSG (TMT\_ART\_SNAPSHOT\_TSG\_REG\_0) – Offset 40301624h

TMT local cross timestamp ART snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301624h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_ART_LOW_TSG_REG:</b> ART bits [31:0] captured when a local cross time stamp capture is enabled.

#### 14.3.2.284 REG RXTS\_TMT\_HIGH\_TSG (TMT\_RXTS\_SNAPSHOT\_TSG\_REG\_1) – Offset 40301628h

TMT remote cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301628h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_RXTS_TMTH_TSG_REG:</b> TMTH captured when a remote time stamp capture is enabled.

#### 14.3.2.285 REG RXTS\_TMT\_LOW\_TSG (TMT\_RXTS\_SNAPSHOT\_TSG\_REG\_0) — Offset 4030162Ch

TMT remote cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	4030162Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_RXTS_TMTL_TSG_REG:</b> TMTL captured when a remote time stamp capture is enabled.

#### 14.3.2.286 REG TMTCTL\_GLOBAL (TMT\_CTL\_GLOBAL\_REG) — Offset 40301640h

TMT control register.

Type	Size	Offset	Default
MMIO	32 bit	40301640h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>TMT ENABLE (TGPI0_TMT_CTRL_GLOBAL_REG):</b> Enables incrementing TMT when set Should be cleared before initializing TMT.

#### 14.3.2.287 REG TMTR\_GLOBAL (TMTR\_GLOBAL\_REG) — Offset 40301644h

TMT timestamp residue register.

Type	Size	Offset	Default
MMIO	32 bit	40301644h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>TGPI0_TMT_TMTR_GLOBAL_REG:</b> TMT residue value defined with a resolution of 2^-32ns.

#### 14.3.2.288 REG TMTL\_GLOBAL (TMTL\_GLOBAL\_REG) — Offset 40301648h

TMT timestamp low register.

Type	Size	Offset	Default
MMIO	32 bit	40301648h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	<b>Reserved</b>
29:0	00000000h RW/V	<b>TGPIO_TMT_TMTH_GLOBAL_REG:</b> Lower Half of the TMT defined in ns..

#### 14.3.2.289 REG TMTH\_GLOBAL (TMTH\_GLOBAL\_REG) — Offset 4030164Ch

TMT timestamp high register.

Type	Size	Offset	Default
MMIO	32 bit	4030164Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>TGPIO_TMT_TMTH_GLOBAL_REG:</b> Upper Half of the TMT defined in ns..

#### 14.3.2.290 REG TIMINCA\_GLOBAL (TMT\_TIMINCA\_GLOBAL\_REG) — Offset 40301650h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	40301650h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>TGPIO_TMT_GLOBAL_TIMINCA_ISIGN:</b> Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	<b>TGPIO_TMT_GLOBAL_TIMINCA_INC_VALUE:</b> Increment Value to be added or subtracted from 5ns clock cycle.

#### 14.3.2.291 REG TIMADJ\_GLOBAL (TMT\_TIMADJ\_GLOBAL\_REG) – Offset 40301654h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	40301654h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>TGPIO_TMT_GLOBAL_TIMADJ_SIGN:</b> 0 = positive 1 = Negative.
30	0h RW	<b>Zero Bit (TGPIO_TMT_GLOBAL_TIMADJ_ZERO_BIT):</b> Zero bit.
29:0	00000000h RW	<b>TGPIO_TMT_GLOBAL_TIMADJ_TADJUS:</b> Time Adjust Value.

#### 14.3.2.292 REG LXTS\_TMT\_LOW\_GLOBAL (TMT\_LXTS\_SNAPSHOT\_GLOBAL\_REG\_0) – Offset 40301658h

TMT local cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301658h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_TMTL_GLOBAL_REG:</b> TMTL captured when a local cross time stamp capture is enabled.

#### 14.3.2.293 REG\_LXTS\_TMT\_HIGH\_GLOBAL (TMT\_LXTS\_SNAPSHOT\_GLOBAL\_REG\_1) – Offset 4030165Ch

TMT local cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	4030165Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_TMTH_GLOBAL_REG:</b> TMTH captured when a local cross time stamp capture is enabled.

#### 14.3.2.294 REG\_LXTS\_ART\_LOW\_GLOBAL (TMT\_ART\_SNAPSHOT\_GLOBAL\_REG\_0) – Offset 40301660h

TMT local cross timestamp ART snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301660h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_ART_LOW_GLOBAL_REG:</b> ART bits [31:0] captured when a local cross time stamp capture is enabled.

#### 14.3.2.295 REG LXTS\_ART\_HIGH\_GLOBAL (TMT\_ART\_SNAPSHOT\_GLOBAL\_REG\_1) – Offset 40301664h

TMT local cross timestamp ART snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	40301664h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_ART_HIGH_GLOBAL_REG:</b> ART bits [63:0] captured when a local cross time stamp capture is enabled.

#### 14.3.2.296 REG RXTS\_TMT\_LOW\_GLOBAL (TMT\_RXTS\_SNAPSHOT\_GLOBAL\_REG\_0) – Offset 40301668h

TMT remote cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301668h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_RXTS_TMTL_GLOBAL_REG:</b> TMTL captured when a remote time stamp capture is enabled.

#### 14.3.2.297 REG RXTS\_TMT\_HIGH\_GLOBAL (TMT\_RXTS\_SNAPSHOT\_GLOBAL\_REG\_1) – Offset 4030166Ch

TMT remote cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	4030166Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_RXTS_TMTH_GLOBAL_REG:</b> TMTH captured when a remote time stamp capture is enabled.

#### 14.3.2.298 REG TMTCTL\_WORKING (TMT\_CTL\_WORKING\_REG) – Offset 40301680h

TMT control register.

Type	Size	Offset	Default
MMIO	32 bit	40301680h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved
0	0h RW	<b>TMT ENABLE (TGPI0_TMT_CTRL_WORKING_REG):</b> Enables incrementing TMT when set Should be cleared before initializing TMT.

#### 14.3.2.299 REG TMTR\_WORKING (TMTR\_WORKING\_REG) — Offset 40301684h

TMT timestamp residue register.

Type	Size	Offset	Default
MMIO	32 bit	40301684h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>TGPI0_TMT_TMTR_WORKING_REG:</b> TMT residue value defined with a resolution of 2^-32ns.

#### 14.3.2.300 REG TMTL\_WORKING (TMTL\_WORKING\_REG) — Offset 40301688h

TMT timestamp low register.

Type	Size	Offset	Default
MMIO	32 bit	40301688h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	<b>Reserved</b>
29:0	00000000h RW/V	<b>TGPIO_TMT_TMTL_WORKING_REG:</b> Lower Half of the TMT defined in ns..

#### 14.3.2.301 REG TMTH\_WORKING (TMTH\_WORKING\_REG) — Offset 4030168Ch

TMT timestamp high register.

Type	Size	Offset	Default
MMIO	32 bit	4030168Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>TGPIO_TMT_TMTH_WORKING_REG:</b> Upper Half of the TMT defined in ns..

#### 14.3.2.302 REG TIMINCA\_WORKING (TMT\_TIMINCA\_WORKING\_REG) — Offset 40301690h

TMT Time Increment Adjust Register.

Type	Size	Offset	Default
MMIO	32 bit	40301690h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>TGPIO_TMT_WORKING_TIMINCA_ISIGN:</b> Increment Sign 0 Each 5ns cycle add to the TMT Timer a value of 5ns + Incvalue*2^-32ns 1 Each 5ns cycle add to the TMT Timer a value of 5ns IncValue*2^-32ns.
30:0	00000000h RW	<b>TGPIO_TMT_WORKING_TIMINCA_INC_VALUE:</b> Increment Value to be added or subtracted from 5ns clock cycle.

#### 14.3.2.303 REG TIMADJ\_WORKING (TMT\_TIMADJ\_WORKING\_REG) – Offset 40301694h

TMT Time Offset Adjust register.

Type	Size	Offset	Default
MMIO	32 bit	40301694h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>TGPIO_TMT_WORKING_TIMADJ_SIGN:</b> 0 = positive 1 = Negative.
30	0h RW	<b>Zero Bit (TGPIO_TMT_WORKING_TIMADJ_ZERO_BIT):</b> Zero bit.
29:0	00000000h RW	<b>TGPIO_TMT_WORKING_TIMADJ_TADJUS:</b> Time Adjust Value.

#### 14.3.2.304 REG LXTS\_TMT\_LOW\_WORKING (TMT\_LXTS\_SNAPSHOT\_WORKING\_REG\_0) – Offset 40301698h

TMT local cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	40301698h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_TMTL_WORKING_REG:</b> TMTL captured when a local cross time stamp capture is enabled.

#### 14.3.2.305 REG LXTS\_TMT\_HIGH\_WORKING (TMT\_LXTS\_SNAPSHOT\_WORKING\_REG\_1) – Offset 4030169Ch

TMT local cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	4030169Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_TMTH_WORKING_REG:</b> TMTH captured when a local cross time stamp capture is enabled.

#### 14.3.2.306 REG LXTS\_ART\_LOW\_WORKING (TMT\_ART\_SNAPSHOT\_WORKING\_REG\_0) – Offset 403016A0h

TMT local cross timestamp ART snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	403016A0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_ART_LOW_WORKING_REG:</b> ART bits [31:0] captured when a local cross time stamp capture is enabled.

#### 14.3.2.307 REG LXTS\_ART\_HIGH\_WORKING (TMT\_ART\_SNAPSHOT\_WORKING\_REG\_1) – Offset 403016A4h

TMT local cross timestamp ART snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	403016A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_LXTS_ART_HIGH_WORKING_REG:</b> ART bits [63:0] captured when a local cross time stamp capture is enabled.

#### 14.3.2.308 REG RXTS\_TMT\_LOW\_WORKING (TMT\_RXTS\_SNAPSHOT\_WORKING\_REG\_0) – Offset 403016A8h

TMT remote cross timestamp snapshot register 0.

Type	Size	Offset	Default
MMIO	32 bit	403016A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_RXTS_TMTL_WORKING_REG:</b> TMTL captured when a remote time stamp capture is enabled.

#### 14.3.2.309 REG\_RXTS\_TMT\_HIGH\_WORKING (TMT\_RXTS\_SNAPSHOT\_WORKING\_REG\_1) – Offset 403016ACh

TMT remote cross timestamp snapshot register 1.

Type	Size	Offset	Default
MMIO	32 bit	403016ACh	00000000h

Register Level Access:

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>TGPIO_RXTS_TMTH_WORKING_REG:</b> TMTH captured when a remote time stamp capture is enabled.

## 14.4 IPC Registers

The IPC registers contain:

- Host Registers
- PMC Registers

IPC Registers	Address Offset	Table
Host	40400000h - 40400C54h	Table 13-13
PMC	40411000h - 404116D4h	Table 13-14

## 14.4.1 Host Registers Summary

Table 14-13. Summary of Host Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40400000h	4	Peripheral Interrupt Status - LH2OSE (PISR_LH2OSE)	00000000h
40400004h	4	Peripheral Interrupt Mask - LH2OSE (PIMR_LH2OSE)	00000000h
40400008h	4	LH2OSE Peripheral Interrupt Mask (HOST_PIMR_LH2OSE)	00000101h
4040000Ch	4	LH2OSE Peripheral Interrupt Status (HOST_PISR_LH2OSE)	00000000h
40400010h	4	LH2OSE Channel Interrupt Mask (CIM_LH2OSE)	00000000h
40400014h	4	LH2OSE Channel Interrupt Status (CIS_LH2OSE)	00000000h
40400034h	4	LH2OSE Firmware Status (ISH_HOST_FWSTS_LH2OSE)	00000000h
40400038h	4	LH2OSE Communication (HOST_COMM_LH2OSE)	00000000h
40400048h	4	Inbound DoorbellLH2OSE To ISH (HOST2ISH_DOORBELL_LH2OSE)	00000000h
40400054h	4	Outbound DoorbellISH To LH2OSE (ISH2HOST_DOORBELL_LH2OSE)	00000000h
40400060h	4	Outbound Inter Processor Message 1 From ISH To LH2OSE (ISH2HOST_MSG1_LH2OSE)	00000000h
40400064h	4	Outbound Inter Processor Message 2 From ISH To LH2OSE (ISH2HOST_MSG2_LH2OSE)	00000000h
40400068h	4	Outbound Inter Processor Message 3 From ISH To LH2OSE (ISH2HOST_MSG3_LH2OSE)	00000000h
4040006Ch	4	Outbound Inter Processor Message 4 From ISH To LH2OSE (ISH2HOST_MSG4_LH2OSE)	00000000h
40400070h	4	Outbound Inter Processor Message 5 From ISH To LH2OSE (ISH2HOST_MSG5_LH2OSE)	00000000h
40400074h	4	Outbound Inter Processor Message 6 From ISH To LH2OSE (ISH2HOST_MSG6_LH2OSE)	00000000h
40400078h	4	Outbound Inter Processor Message 7 From ISH To LH2OSE (ISH2HOST_MSG7_LH2OSE)	00000000h
4040007Ch	4	Outbound Inter Processor Message 8 From ISH To LH2OSE (ISH2HOST_MSG8_LH2OSE)	00000000h
40400080h	4	Outbound Inter Processor Message 9 From ISH To LH2OSE (ISH2HOST_MSG9_LH2OSE)	00000000h
40400084h	4	Outbound Inter Processor Message 10 From ISH To LH2OSE (ISH2HOST_MSG10_LH2OSE)	00000000h
40400088h	4	Outbound Inter Processor Message 11 From ISH To LH2OSE (ISH2HOST_MSG11_LH2OSE)	00000000h
4040008Ch	4	Outbound Inter Processor Message 12 From ISH To LH2OSE (ISH2HOST_MSG12_LH2OSE)	00000000h
40400090h	4	Outbound Inter Processor Message 13 From ISH To LH2OSE (ISH2HOST_MSG13_LH2OSE)	00000000h
40400094h	4	Outbound Inter Processor Message 14 From ISH To LH2OSE (ISH2HOST_MSG14_LH2OSE)	00000000h
40400098h	4	Outbound Inter Processor Message 15 From ISH To LH2OSE (ISH2HOST_MSG15_LH2OSE)	00000000h
4040009Ch	4	Outbound Inter Processor Message 16 From ISH To LH2OSE (ISH2HOST_MSG16_LH2OSE)	00000000h
404000A0h	4	Outbound Inter Processor Message 17 From ISH To LH2OSE (ISH2HOST_MSG17_LH2OSE)	00000000h

<b>Offset</b>	<b>Size (Bytes)</b>	<b>Register Name (Register Symbol)</b>	<b>Default Value</b>
404000A4h	4	Outbound Inter Processor Message 18 From ISH To LH2OSE (ISH2HOST_MSG18_LH2OSE)	00000000h
404000A8h	4	Outbound Inter Processor Message 19 From ISH To LH2OSE (ISH2HOST_MSG19_LH2OSE)	00000000h
404000ACh	4	Outbound Inter Processor Message 20 From ISH To LH2OSE (ISH2HOST_MSG20_LH2OSE)	00000000h
404000B0h	4	Outbound Inter Processor Message 21 From ISH To LH2OSE (ISH2HOST_MSG21_LH2OSE)	00000000h
404000B4h	4	Outbound Inter Processor Message 22 From ISH To LH2OSE (ISH2HOST_MSG22_LH2OSE)	00000000h
404000B8h	4	Outbound Inter Processor Message 23 From ISH To LH2OSE (ISH2HOST_MSG23_LH2OSE)	00000000h
404000BCh	4	Outbound Inter Processor Message 24 From ISH To LH2OSE (ISH2HOST_MSG24_LH2OSE)	00000000h
404000C0h	4	Outbound Inter Processor Message 25 From ISH To LH2OSE (ISH2HOST_MSG25_LH2OSE)	00000000h
404000C4h	4	Outbound Inter Processor Message 26 From ISH To LH2OSE (ISH2HOST_MSG26_LH2OSE)	00000000h
404000C8h	4	Outbound Inter Processor Message 27 From ISH To LH2OSE (ISH2HOST_MSG27_LH2OSE)	00000000h
404000CCh	4	Outbound Inter Processor Message 28 From ISH To LH2OSE (ISH2HOST_MSG28_LH2OSE)	00000000h
404000D0h	4	Outbound Inter Processor Message 29 From ISH To LH2OSE (ISH2HOST_MSG29_LH2OSE)	00000000h
404000D4h	4	Outbound Inter Processor Message 30 From ISH To LH2OSE (ISH2HOST_MSG30_LH2OSE)	00000000h
404000D8h	4	Outbound Inter Processor Message 31 From ISH To LH2OSE (ISH2HOST_MSG31_LH2OSE)	00000000h
404000DCh	4	Outbound Inter Processor Message 32 From ISH To LH2OSE (ISH2HOST_MSG32_LH2OSE)	00000000h
404000E0h	4	Inbound Inter Processor Message 1 From LH2OSE To ISH (HOST2ISH_MSG1_LH2OSE)	00000000h
404000E4h	4	Inbound Inter Processor Message 2 From LH2OSE To ISH (HOST2ISH_MSG2_LH2OSE)	00000000h
404000E8h	4	Inbound Inter Processor Message 3 From LH2OSE To ISH (HOST2ISH_MSG3_LH2OSE)	00000000h
404000ECh	4	Inbound Inter Processor Message 4 From LH2OSE To ISH (HOST2ISH_MSG4_LH2OSE)	00000000h
404000F0h	4	Inbound Inter Processor Message 5 From LH2OSE To ISH (HOST2ISH_MSG5_LH2OSE)	00000000h
404000F4h	4	Inbound Inter Processor Message 6 From LH2OSE To ISH (HOST2ISH_MSG6_LH2OSE)	00000000h
404000F8h	4	Inbound Inter Processor Message 7 From LH2OSE To ISH (HOST2ISH_MSG7_LH2OSE)	00000000h
404000FCh	4	Inbound Inter Processor Message 8 From LH2OSE To ISH (HOST2ISH_MSG8_LH2OSE)	00000000h
40400100h	4	Inbound Inter Processor Message 9 From LH2OSE To ISH (HOST2ISH_MSG9_LH2OSE)	00000000h
40400104h	4	Inbound Inter Processor Message 10 From LH2OSE To ISH (HOST2ISH_MSG10_LH2OSE)	00000000h
40400108h	4	Inbound Inter Processor Message 11 From LH2OSE To ISH (HOST2ISH_MSG11_LH2OSE)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
4040010Ch	4	Inbound Inter Processor Message 12 From LH2OSE To ISH (HOST2ISH_MSG12_LH2OSE)	00000000h
40400110h	4	Inbound Inter Processor Message 13 From LH2OSE To ISH (HOST2ISH_MSG13_LH2OSE)	00000000h
40400114h	4	Inbound Inter Processor Message 14 From LH2OSE To ISH (HOST2ISH_MSG14_LH2OSE)	00000000h
40400118h	4	Inbound Inter Processor Message 15 From LH2OSE To ISH (HOST2ISH_MSG15_LH2OSE)	00000000h
4040011Ch	4	Inbound Inter Processor Message 16 From LH2OSE To ISH (HOST2ISH_MSG16_LH2OSE)	00000000h
40400120h	4	Inbound Inter Processor Message 17 From LH2OSE To ISH (HOST2ISH_MSG17_LH2OSE)	00000000h
40400124h	4	Inbound Inter Processor Message 18 From LH2OSE To ISH (HOST2ISH_MSG18_LH2OSE)	00000000h
40400128h	4	Inbound Inter Processor Message 19 From LH2OSE To ISH (HOST2ISH_MSG19_LH2OSE)	00000000h
4040012Ch	4	Inbound Inter Processor Message 20 From LH2OSE To ISH (HOST2ISH_MSG20_LH2OSE)	00000000h
40400130h	4	Inbound Inter Processor Message 21 From LH2OSE To ISH (HOST2ISH_MSG21_LH2OSE)	00000000h
40400134h	4	Inbound Inter Processor Message 22 From LH2OSE To ISH (HOST2ISH_MSG22_LH2OSE)	00000000h
40400138h	4	Inbound Inter Processor Message 23 From LH2OSE To ISH (HOST2ISH_MSG23_LH2OSE)	00000000h
4040013Ch	4	Inbound Inter Processor Message 24 From LH2OSE To ISH (HOST2ISH_MSG24_LH2OSE)	00000000h
40400140h	4	Inbound Inter Processor Message 25 From LH2OSE To ISH (HOST2ISH_MSG25_LH2OSE)	00000000h
40400144h	4	Inbound Inter Processor Message 26 From LH2OSE To ISH (HOST2ISH_MSG26_LH2OSE)	00000000h
40400148h	4	Inbound Inter Processor Message 27 From LH2OSE To ISH (HOST2ISH_MSG27_LH2OSE)	00000000h
4040014Ch	4	Inbound Inter Processor Message 28 From LH2OSE To ISH (HOST2ISH_MSG28_LH2OSE)	00000000h
40400150h	4	Inbound Inter Processor Message 29 From LH2OSE To ISH (HOST2ISH_MSG29_LH2OSE)	00000000h
40400154h	4	Inbound Inter Processor Message 30 From LH2OSE To ISH (HOST2ISH_MSG30_LH2OSE)	00000000h
40400158h	4	Inbound Inter Processor Message 31 From LH2OSE To ISH (HOST2ISH_MSG31_LH2OSE)	00000000h
4040015Ch	4	Inbound Inter Processor Message 32 From LH2OSE To ISH (HOST2ISH_MSG32_LH2OSE)	00000000h
40400360h	4	Remap0 For LH2OSE (REMAP0_LH2OSE)	00000000h
40400364h	4	Remap1 For LH2OSE (REMAP1_LH2OSE)	00000000h
40400368h	4	Remap2 For LH2OSE (REMAP2_LH2OSE)	00000000h
4040036Ch	4	Remap3 For LH2OSE (REMAP3_LH2OSE)	00000000h
40400370h	4	Remap4 For LH2OSE (REMAP4_LH2OSE)	00000000h
40400374h	4	Remap5 For LH2OSE (REMAP5_LH2OSE)	00000000h
40400378h	4	ISH IPC Busy Clear For LH2OSE (ISH_IPC_BUSY_CLEAR_LH2OSE)	00000000h
404006D0h	4	D0i3 Control For LH2OSE (IPC_D0I3C_LH2OSE)	00000008h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40400900h	4	Ownership Control 0 (OWNERSHIP_CTRL0_LH2OSE)	00000000h
40400904h	4	Ownership Control 1 (OWNERSHIP_CTRL1_LH2OSE)	00000000h
40400908h	4	Ownership Control 2 (OWNERSHIP_CTRL2_LH2OSE)	00000000h
4040090Ch	4	Ownership Control 3 (OWNERSHIP_CTRL3_LH2OSE)	00000000h
40400910h	4	Ownership Control 4 (OWNERSHIP_CTRL4_LH2OSE)	00000000h
40400914h	4	Ownership Control 5 (OWNERSHIP_CTRL5_LH2OSE)	00000000h
40400918h	4	Ownership Control 6 (OWNERSHIP_CTRL6_LH2OSE)	00000000h
4040091Ch	4	Ownership Control 7 (OWNERSHIP_CTRL7_LH2OSE)	00000000h
40400B00h	4	TGPIO Mux Sel 0 For LH2OSE (TGPIO_MUX_SEL_REG_0_LH2OSE)	00000000h
40400B04h	4	TGPIO Mux Sel 1 For LH2OSE (TGPIO_MUX_SEL_REG_1_LH2OSE)	00000000h
40400C00h	4	Feature Disablel 0 For LH2OSE (FEATURE_DISABLE_REG_0_LH2OSE)	00000000h
40400C04h	4	Feature Disablel 1 For LH2OSE (FEATURE_DISABLE_REG_1_LH2OSE)	00000000h
40400C50h	4	Fuse Disable 0 (FUSE_DISABLE_REG_0_LH2OSE)	00000000h
40400C54h	4	LH2OSE ISH BIOS Selfshoot Reset (ISH_BIOS_SELFSHOOT_RST_LH2OSE)	00000000h

#### 14.4.1.1 Peripheral Interrupt Status - LH2OSE (PISR\_LH2OSE) — Offset 40400000h

This register contains the inbound interrupt status bits for the LH2OSE IPC channel. Interrupts are generated when PISR[x] & PIMR[x] are both set.

Type	Size	Offset	Default
MMIO	32 bit	40400000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved</b>
27	0h RW/1C	<b>PISR_H2IBCISC:</b> Host2ISH busy clear interrupt status clear interrupt: 1 -> Interrupt is active 0 -> Interrupt is inactive. Writing 1 to this bit clears it.
26:1	0h RO	<b>Reserved</b>
0	0h RO	<b>PISR_HOST2ISH:</b> Inbound IPC request from HOST to ISH status: 1 -> Interrupt is active 0 -> Interrupt is inactive.

#### 14.4.1.2 Peripheral Interrupt Mask - LH2OSE (PIMR\_LH2OSE) — Offset 40400004h

This register enables or disables Inbound interrupts from LH2OSE to ISH. This register is not accessible by LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	40400004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved</b>
27	0h RW	<b>H2IBCISC_IE:</b> Mask bit for H2IBCISC interrupt mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
26:12	0h RO	<b>Reserved</b>
11	0h RW	<b>PIMR_ISH2HOST_BUSY_CLEAR:</b> Mask bit for ISH2HOST busy clear interrupt 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
10:1	0h RO	<b>Reserved</b>
0	0h RW	<b>PIMR_HOST2ISH:</b> Reserved

#### 14.4.1.3 LH2OSE Peripheral Interrupt Mask (HOST\_PIMR\_LH2OSE) — Offset 40400008h

This register is for enabling the interrupts generated by ISH towards LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	40400008h	00000101h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	1h NA	<b>PIMR_HOST2ISH_BUSY_CLEAR:</b> Host2ISH busy clear interrupt mask bit 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
7:1	0h RO	<b>Reserved</b>
0	1h NA	<b>PIMR_ISH2HOST_IPC_REG:</b> Outbound IPC request from ISH to HOST Mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.

#### 14.4.1.4 LH2OSE Peripheral Interrupt Status (HOST\_PISR\_LH2OSE) — Offset 4040000Ch

Interrupt status register for interrupts to LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	4040000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h NA	<b>PISR_HOST2ISH_BUSY_CLEAR:</b> Host2ISH busy clear interrupt status bit 1 -> Interrupt is active.
7:1	0h RO	<b>Reserved</b>
0	0h NA	<b>PISR_ISH2HOST_IPC_REG:</b> Outbound IPC request from ISH to HOST Status 1 -> Interrupt.

#### 14.4.1.5 LH2OSE Channel Interrupt Mask (CIM\_LH2OSE) — Offset 40400010h

This register is for masking the per channel interrupt, caused by any of the interrupt sources towards mIA in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	40400010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>CH_INTR_MASK:</b> Enable interrupts towards MIA for the channel. 1 -> Interrupt is masked 0 -> Interrupt is enabled.

#### 14.4.1.6 LH2OSE Channel Interrupt Status (CIS\_LH2OSE) — Offset 40400014h

This register provides the per channel interrupt status, this is set if any of the interrupt sources towards mIA are set in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	40400014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO	<b>CH_INTR_STATUS:</b> Interrupt status for the interrupts to MIA for the channel. This will be set if any of the interrupt sources are enabled and their status is high.

#### 14.4.1.7 LH2OSE Firmware Status (ISH\_HOST\_FWSTS\_LH2OSE) — Offset 40400034h

Writeable by ISH, RO by LH2OSE, this is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. As the firmware comes up after the reset or power cycle it sets bits of this register to 1b1 to indicate its status.

Type	Size	Offset	Default
MMIO	32 bit	40400034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>ISH_HOST_FWSTS:</b> ISH Host firmware status.

#### 14.4.1.8 LH2OSE Communication (HOST\_COMM\_LH2OSE) – Offset 40400038h

Writable by LH2OSE, RO by ISH, this is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. The Host sets bits of this register to 1b1 to communicate with the ISH.

Type	Size	Offset	Default
MMIO	32 bit	40400038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>HOST_COMM:</b> Host communication register.

#### 14.4.1.9 Inbound Doorbell LH2OSE To ISH (HOST2ISH\_DOORBELL\_LH2OSE) – Offset 40400048h

Inbound doorbell register, from LH2OSE core to interrupt ISH. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. When software writes the message in to respective message register, it should set bit 31(BUSY Bit) of doorbell register to indicate that new data is written. The ISH will assert a level sensitive interrupt to the IOAPIC as long as the BUSY bit is set. When the ISH reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	40400048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>BUSY:</b> When this bit is cleared, the ISH CPU is Ready to accept a new message.
30:0	00000000h RW	<b>PAYOUTLOAD_31BIT:</b> 31bits message payload for backward compatibility.

#### 14.4.1.10 Outbound Doorbell ISH To LH2OSE (ISH2HOST\_DOORBELL\_LH2OSE) — Offset 40400054h

Outbound doorbell register for the ISH to interrupt LH2OSE. Setting bit 31 of this register causes the Host to receive a IRQn interrupt. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. The ISH will set bit 31 of this reg to ring the doorbell after it has completed programming the message to Host. When the Host reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	40400054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>BUSY:</b> When this bit is cleared, the HOST CPU is Ready to accept a new message.
30:0	00000000h RW	<b>PAYOUTLOAD_31BIT:</b> 31bits message payload for backward compatibility.

#### **14.4.1.11 Outbound Inter Processor Message 1 From ISH To LH2OSE (ISH2HOST\_MSG1\_LH2OSE) — Offset 40400060h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	40400060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>MSG:</b> Message from ISH to LH2OSE.

#### **14.4.1.12 Outbound Inter Processor Message 2 From ISH To LH2OSE (ISH2HOST\_MSG2\_LH2OSE) — Offset 40400064h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.13 Outbound Inter Processor Message 3 From ISH To LH2OSE (ISH2HOST\_MSG3\_LH2OSE) — Offset 40400068h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.14 Outbound Inter Processor Message 4 From ISH To LH2OSE (ISH2HOST\_MSG4\_LH2OSE) — Offset 4040006Ch**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.15 Outbound Inter Processor Message 5 From ISH To LH2OSE (ISH2HOST\_MSG5\_LH2OSE) — Offset 40400070h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.16 Outbound Inter Processor Message 6 From ISH To LH2OSE (ISH2HOST\_MSG6\_LH2OSE) — Offset 40400074h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.17 Outbound Inter Processor Message 7 From ISH To LH2OSE (ISH2HOST\_MSG7\_LH2OSE) — Offset 40400078h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.18 Outbound Inter Processor Message 8 From ISH To LH2OSE (ISH2HOST\_MSG8\_LH2OSE) — Offset 4040007Ch**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.19 Outbound Inter Processor Message 9 From ISH To LH2OSE (ISH2HOST\_MSG9\_LH2OSE) — Offset 40400080h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.20 Outbound Inter Processor Message 10 From ISH To LH2OSE (ISH2HOST\_MSG10\_LH2OSE) — Offset 40400084h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.21 Outbound Inter Processor Message 11 From ISH To LH2OSE (ISH2HOST\_MSG11\_LH2OSE) — Offset 40400088h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.22 Outbound Inter Processor Message 12 From ISH To LH2OSE (ISH2HOST\_MSG12\_LH2OSE) — Offset 4040008Ch**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.23 Outbound Inter Processor Message 13 From ISH To LH2OSE (ISH2HOST\_MSG13\_LH2OSE) — Offset 40400090h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.24 Outbound Inter Processor Message 14 From ISH To LH2OSE (ISH2HOST\_MSG14\_LH2OSE) — Offset 40400094h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.25 Outbound Inter Processor Message 15 From ISH To LH2OSE (ISH2HOST\_MSG15\_LH2OSE) — Offset 40400098h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.26 Outbound Inter Processor Message 16 From ISH To LH2OSE (ISH2HOST\_MSG16\_LH2OSE) — Offset 4040009Ch**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.27 Outbound Inter Processor Message 17 From ISH To LH2OSE (ISH2HOST\_MSG17\_LH2OSE) — Offset 404000A0h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.28 Outbound Inter Processor Message 18 From ISH To LH2OSE (ISH2HOST\_MSG18\_LH2OSE) — Offset 404000A4h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.29 Outbound Inter Processor Message 19 From ISH To LH2OSE (ISH2HOST\_MSG19\_LH2OSE) — Offset 404000A8h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.30 Outbound Inter Processor Message 20 From ISH To LH2OSE (ISH2HOST\_MSG20\_LH2OSE) — Offset 404000ACh**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.31 Outbound Inter Processor Message 21 From ISH To LH2OSE (ISH2HOST\_MSG21\_LH2OSE) — Offset 404000B0h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.32 Outbound Inter Processor Message 22 From ISH To LH2OSE (ISH2HOST\_MSG22\_LH2OSE) — Offset 404000B4h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.33 Outbound Inter Processor Message 23 From ISH To LH2OSE (ISH2HOST\_MSG23\_LH2OSE) — Offset 404000B8h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.34 Outbound Inter Processor Message 24 From ISH To LH2OSE (ISH2HOST\_MSG24\_LH2OSE) — Offset 404000BCh**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.35 Outbound Inter Processor Message 25 From ISH To LH2OSE (ISH2HOST\_MSG25\_LH2OSE) — Offset 404000C0h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.36 Outbound Inter Processor Message 26 From ISH To LH2OSE (ISH2HOST\_MSG26\_LH2OSE) — Offset 404000C4h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.37 Outbound Inter Processor Message 27 From ISH To LH2OSE (ISH2HOST\_MSG27\_LH2OSE) — Offset 404000C8h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.38 Outbound Inter Processor Message 28 From ISH To LH2OSE (ISH2HOST\_MSG28\_LH2OSE) — Offset 404000CCh**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.39 Outbound Inter Processor Message 29 From ISH To LH2OSE (ISH2HOST\_MSG29\_LH2OSE) — Offset 404000D0h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.40 Outbound Inter Processor Message 30 From ISH To LH2OSE (ISH2HOST\_MSG30\_LH2OSE) — Offset 404000D4h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.41 Outbound Inter Processor Message 31 From ISH To LH2OSE (ISH2HOST\_MSG31\_LH2OSE) — Offset 404000D8h**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.42 Outbound Inter Processor Message 32 From ISH To LH2OSE (ISH2HOST\_MSG32\_LH2OSE) — Offset 404000DCh**

Inter-process Message registers for ISH core to communicate to LH2OSE. These are eight 32bit registers that hold the message payload from the ISH to LH2OSE. These registers are meant to be written by the ISH and read by LH2OSE. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as ISH2HOST\_MSG1\_LH2OSE, offset 40400060h.

#### **14.4.1.43 Inbound Inter Processor Message 1 From LH2OSE To ISH (HOST2ISH\_MSG1\_LH2OSE) — Offset 404000E0h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	404000E0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>MSG:</b> Message from LH2OSE to ISH.

#### 14.4.1.44 Inbound Inter Processor Message 2 From LH2OSE To ISH (HOST2ISH\_MSG2\_LH2OSE) — Offset 404000E4h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### 14.4.1.45 Inbound Inter Processor Message 3 From LH2OSE To ISH (HOST2ISH\_MSG3\_LH2OSE) — Offset 404000E8h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### 14.4.1.46 Inbound Inter Processor Message 4 From LH2OSE To ISH (HOST2ISH\_MSG4\_LH2OSE) — Offset 404000ECh

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.47 Inbound Inter Processor Message 5 From LH2OSE To ISH (HOST2ISH\_MSG5\_LH2OSE) — Offset 404000F0h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.48 Inbound Inter Processor Message 6 From LH2OSE To ISH (HOST2ISH\_MSG6\_LH2OSE) — Offset 404000F4h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.49 Inbound Inter Processor Message 7 From LH2OSE To ISH (HOST2ISH\_MSG7\_LH2OSE) — Offset 404000F8h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.50 Inbound Inter Processor Message 8 From LH2OSE To ISH (HOST2ISH\_MSG8\_LH2OSE) — Offset 404000FCh**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.51 Inbound Inter Processor Message 9 From LH2OSE To ISH (HOST2ISH\_MSG9\_LH2OSE) — Offset 40400100h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.52 Inbound Inter Processor Message 10 From LH2OSE To ISH (HOST2ISH\_MSG10\_LH2OSE) — Offset 40400104h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.53 Inbound Inter Processor Message 11 From LH2OSE To ISH (HOST2ISH\_MSG11\_LH2OSE) — Offset 40400108h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.54 Inbound Inter Processor Message 12 From LH2OSE To ISH (HOST2ISH\_MSG12\_LH2OSE) — Offset 4040010Ch**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.55 Inbound Inter Processor Message 13 From LH2OSE To ISH (HOST2ISH\_MSG13\_LH2OSE) — Offset 40400110h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.56 Inbound Inter Processor Message 14 From LH2OSE To ISH (HOST2ISH\_MSG14\_LH2OSE) — Offset 40400114h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.57 Inbound Inter Processor Message 15 From LH2OSE To ISH (HOST2ISH\_MSG15\_LH2OSE) — Offset 40400118h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.58 Inbound Inter Processor Message 16 From LH2OSE To ISH (HOST2ISH\_MSG16\_LH2OSE) — Offset 4040011Ch**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.59 Inbound Inter Processor Message 17 From LH2OSE To ISH (HOST2ISH\_MSG17\_LH2OSE) — Offset 40400120h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.60 Inbound Inter Processor Message 18 From LH2OSE To ISH (HOST2ISH\_MSG18\_LH2OSE) — Offset 40400124h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.61 Inbound Inter Processor Message 19 From LH2OSE To ISH (HOST2ISH\_MSG19\_LH2OSE) — Offset 40400128h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.62 Inbound Inter Processor Message 20 From LH2OSE To ISH (HOST2ISH\_MSG20\_LH2OSE) — Offset 4040012Ch**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.63 Inbound Inter Processor Message 21 From LH2OSE To ISH (HOST2ISH\_MSG21\_LH2OSE) — Offset 40400130h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.64 Inbound Inter Processor Message 22 From LH2OSE To ISH (HOST2ISH\_MSG22\_LH2OSE) — Offset 40400134h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.65 Inbound Inter Processor Message 23 From LH2OSE To ISH (HOST2ISH\_MSG23\_LH2OSE) — Offset 40400138h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.66 Inbound Inter Processor Message 24 From LH2OSE To ISH (HOST2ISH\_MSG24\_LH2OSE) — Offset 4040013Ch**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.67 Inbound Inter Processor Message 25 From LH2OSE To ISH (HOST2ISH\_MSG25\_LH2OSE) — Offset 40400140h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.68 Inbound Inter Processor Message 26 From LH2OSE To ISH (HOST2ISH\_MSG26\_LH2OSE) — Offset 40400144h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.69 Inbound Inter Processor Message 27 From LH2OSE To ISH (HOST2ISH\_MSG27\_LH2OSE) — Offset 40400148h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.70 Inbound Inter Processor Message 28 From LH2OSE To ISH (HOST2ISH\_MSG28\_LH2OSE) — Offset 4040014Ch**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### **14.4.1.71 Inbound Inter Processor Message 29 From LH2OSE To ISH (HOST2ISH\_MSG29\_LH2OSE) — Offset 40400150h**

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### 14.4.1.72 Inbound Inter Processor Message 30 From LH2OSE To ISH (HOST2ISH\_MSG30\_LH2OSE) — Offset 40400154h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### 14.4.1.73 Inbound Inter Processor Message 31 From LH2OSE To ISH (HOST2ISH\_MSG31\_LH2OSE) — Offset 40400158h

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### 14.4.1.74 Inbound Inter Processor Message 32 From LH2OSE To ISH (HOST2ISH\_MSG32\_LH2OSE) — Offset 4040015Ch

Inter-process Message registers for LH2OSE to communicate to the ISH. These are eight 32bit registers that hold the message payload from LH2OSE to ISH. These registers are meant to be written by LH2OSE and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_LH2OSE, offset 404000E0h.

#### 14.4.1.75 Remap0 For LH2OSE (REMAP0\_LH2OSE) — Offset 40400360h

General purpose Remap regs.

Type	Size	Offset	Default
MMIO	32 bit	40400360h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>REMAP:</b> Remap.

#### **14.4.1.76 Remap1 For LH2OSE (REMAP1\_LH2OSE) – Offset 40400364h**

General purpose Remap regs.

**Note:** Bit definitions are the same as REMAP0\_LH2OSE, offset 40400360h.

#### **14.4.1.77 Remap2 For LH2OSE (REMAP2\_LH2OSE) – Offset 40400368h**

General purpose Remap regs.

**Note:** Bit definitions are the same as REMAP0\_LH2OSE, offset 40400360h.

#### **14.4.1.78 Remap3 For LH2OSE (REMAP3\_LH2OSE) – Offset 4040036Ch**

General purpose Remap regs.

**Note:** Bit definitions are the same as REMAP0\_LH2OSE, offset 40400360h.

#### **14.4.1.79 Remap4 For LH2OSE (REMAP4\_LH2OSE) – Offset 40400370h**

General purpose Remap regs.

**Note:** Bit definitions are the same as REMAP0\_LH2OSE, offset 40400360h.

#### **14.4.1.80 Remap5 For LH2OSE (REMAP5\_LH2OSE) – Offset 40400374h**

General purpose Remap regs.

**Note:** Bit definitions are the same as REMAP0\_LH2OSE, offset 40400360h.

#### **14.4.1.81 ISH IPC Busy Clear For LH2OSE (ISH\_IPC\_BUSY\_CLEAR\_LH2OSE) – Offset 40400378h**

This register holds the status of the ISH IPC busy clear interrupts. ISH IPC busy clear interrupt is set when busy bit of respective outbound doorbell register gets cleared and interrupt is cleared when ISH writes 1 to respective bit in ISH IPC busy clear register.

Type	Size	Offset	Default
MMIO	32 bit	40400378h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW/1C	<b>ISH2HOST_BUSY_CLEAR:</b> Busy clear interrupt bit of ISH2HOST IPC 1 -> Interrupt active 0 -> Interrupt inactive.

#### 14.4.1.82 D0i3 Control For LH2OSE (IPC\_D0I3C\_LH2OSE) — Offset 404006D0h

This register is will be used for D0i3 SW flow. The description below also includes the type of access expected for the ISH FW for each configuration bit: 1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost. 2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit. 3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW. 4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW (Write 1 to clear?). A simple edge detect logic as shown in Figure 1 can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following: 1. The device idle capability parameter (ENABLE\_PCI\_IDLE\_CAP) need to be connected to a soft strap for ISH with a value of 1. 2. The STRAP for the MMIO address (strap\_d0i3\_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap\_d0i3\_valid) bit needs should be appropriately tied. 3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set\_device\_pg\_config\_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	404006D0h	00000008h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO	<b>Interrupt Request Capable (IRC):</b> Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RO	<b>Restore Required (RR):</b> When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RO	<b>D0i3:</b> SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RO	<b>Interrupt Required (IR):</b> SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RW/1C	<b>Command In Progress (CIP):</b> HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

#### 14.4.1.83 Ownership Control 0 (OWNERSHIP\_CTRL0\_LH2OSE) — Offset 40400900h

Controls Ownership and Interrupt delivery for devices 7 to 0.

Type	Size	Offset	Default
MMIO	32 bit	40400900h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access

RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RO	<b>Pin Mux Sel (TGPIO_MUX_SEL):</b> 2'b00 -Config 1 : All 30 pins are from GPIO i.e GPIO_OUT[29:0] = GPIO[29:0] 2'b01 -Config 2 : GPIO_OUT[29:0] = {GPIO[19:0], GPIO[9:0]} 2'b10 -Config 3 : GPIO_OUT[29:0] = {GPIO[29:20], GPIO[19:0]} 2'b11 -Config 4: GPIO_OUT[29:0] = {GPIO[19:10], GPIO[19:10], GPIO[9:0]} .

#### 14.4.1.92 TGPIO Mux Sel 1 For LH2OSE (TGPIO\_MUX\_SEL\_REG\_1\_LH2OSE) – Offset 40400B04h

Pin Mux Select Register for LH2OSE.

**Note:** Bit definitions are the same as TGPIO\_MUX\_SEL\_REG\_0\_LH2OSE, offset 40400B00h.

#### 14.4.1.93 Feature Disablel 0 For LH2OSE (FEATURE\_DISABLE\_REG\_0\_LH2OSE) – Offset 40400C00h

OSE will implement a BIOS writable register called FEATURE\_DISABLEn in BIOS section of LH2OSE IPC. Below are the bit fields of that register. Each bit corresponds to a particular Sub-IP in OSE. When the FEATURE\_DISABLE for that SubIP is set, OSE HW will clock gate the SubIP. If FW tries to access the clock-gated SubIP, then the access would result in a fabric timeout error/interrupt. FW has to then follow the error recovery process.

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RO	<b>ARM NIDEN (ARM_NIDEN):</b> Non-invasive debug enable, When LOW, disables all trace and non-invasive debug features. Either tie HIGH or connect to debug authentication module
7	0h RO	<b>Feature Desirable For GBE1_PROXY (FEATURE_DISABLE_GBE1_PROXY):</b> Feature desirable for GBE1_PROXY.
6	0h RO	<b>Feature Desirable For GBE0_PROXY (FEATURE_DISABLE_GBE0_PROXY):</b> Feature desirable for GBE0_PROXY.
5	0h RO	<b>Feature Desirable For SBEP (FEATURE_DISABLE_SBEP):</b> Feature desirable for SBEP.
4	0h RO	<b>Feature Desirable For GBE1 (FEATURE_DISABLE_GBE1):</b> Feature desirable for GBE1.
3	0h RO	<b>Feature Desirable For GBE0 (FEATURE_DISABLE_GBE0):</b> Feature desirable for GBE0.
2	0h RO	<b>Feature Desirable For DMA2 (FEATURE_DISABLE_DMA2):</b> Feature desirable for DMA2.
1	0h RO	<b>Feature Desirable For DMA1 (FEATURE_DISABLE_DMA1):</b> Feature desirable for DMA1.
0	0h RO	<b>Feature Desirable For DMA0 (FEATURE_DISABLE_DMA0):</b> Feature desirable for DMA0.

#### 14.4.1.95 Fuse Disable 0 (FUSE\_DISABLE\_REG\_0\_LH2OSE) — Offset 40400C50h

Fuse Disable Info Register for LH2OSE.

Type	Size	Offset	Default
MMIO	32 bit	40400C50h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RO	<b>Ownership Device7 (TGPIO_FUSE_DISABLE):</b> TGPIO Fuse Disable. When these fuses are set to disable the corresponding IPs - it is expected that BIOS will disable the corresponding PCI config space of the IP and program the ownership to NULL.
2	0h RO	<b>Interrupt Delivery Device6 (ADC_FUSE_DISABLE):</b> ADC Fuse Disable. When these fuses are set to disable the corresponding IPs - it is expected that BIOS will disable the corresponding PCI config space of the IP and program the ownership to NULL.
1	0h RO	<b>Ownership Device6 (QEP_FUSE_DISABLE):</b> QEP Fuse Disable. When these fuses are set to disable the corresponding IPs - it is expected that BIOS will disable the corresponding PCI config space of the IP and program the ownership to NULL.
0	0h RO	<b>Interrupt Delivery Device5 (PWM_FUSE_DISABLE):</b> PWM Fuse Disable. When these fuses are set to disable the corresponding IPs - it is expected that BIOS will disable the corresponding PCI config space of the IP and program the ownership to NULL.

#### 14.4.1.96 LH2OSE ISH BIOS Selfshoot Reset (ISH\_BIOS\_SELFSHOOT\_RST\_LH2OSE) – Offset 40400C54h

Though writeable by LH2OSE, this register is reserved for LH2OSE, LH2OSE should not write to this register. The reset register is a 32 bit register that can be written by BIOS. Setting bit 1 will cause MinuteIA to reset.

Type	Size	Offset	Default
MMIO	32 bit	40400C54h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>BIOS_RESET_BIT:</b> ISH BIOS Self shoot Reset Register 1 -> Reset active 0 -> Reset inactive.

## 14.4.2 PMC Registers Summary

**Table 14-14. Summary of PMC Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40411000h	4	Peripheral Interrupt Status - PMC (PISR_PMC)	00000000h
40411004h	4	Peripheral Interrupt Mask - PMC (PIMR_PMC)	00000000h
40411008h	4	PMC Peripheral Interrupt Mask (HOST_PIMR_PMC)	00000101h
4041100Ch	4	PMC Peripheral Interrupt Status (HOST_PISR_PMC)	00000000h
40411010h	4	PMC Channel Interrupt Mask (CIM_PMC)	00000000h
40411014h	4	PMC Channel Interrupt Status (CIS_PMC)	00000000h
40411048h	4	Inbound DoorbellPMC To ISH (HOST2ISH_DOORBELL_PMC)	00000000h
40411054h	4	Outbound DoorbellISH To PMC (ISH2HOST_DOORBELL_PMC)	00000000h
404110E0h	4	Inbound Inter Processor Message 1 From PMC To ISH (HOST2ISH_MSG1_PMC)	00000000h
404110E4h	4	Inbound Inter Processor Message 2 From PMC To ISH (HOST2ISH_MSG2_PMC)	00000000h
404110E8h	4	Inbound Inter Processor Message 3 From PMC To ISH (HOST2ISH_MSG3_PMC)	00000000h
404110ECh	4	Inbound Inter Processor Message 4 From PMC To ISH (HOST2ISH_MSG4_PMC)	00000000h
404110F0h	4	Inbound Inter Processor Message 5 From PMC To ISH (HOST2ISH_MSG5_PMC)	00000000h
404110F4h	4	Inbound Inter Processor Message 6 From PMC To ISH (HOST2ISH_MSG6_PMC)	00000000h
404110F8h	4	Inbound Inter Processor Message 7 From PMC To ISH (HOST2ISH_MSG7_PMC)	00000000h
404110FCh	4	Inbound Inter Processor Message 8 From PMC To ISH (HOST2ISH_MSG8_PMC)	00000000h
40411100h	4	Inbound Inter Processor Message 9 From PMC To ISH (HOST2ISH_MSG9_PMC)	00000000h
40411104h	4	Inbound Inter Processor Message 10 From PMC To ISH (HOST2ISH_MSG10_PMC)	00000000h
40411108h	4	Inbound Inter Processor Message 11 From PMC To ISH (HOST2ISH_MSG11_PMC)	00000000h
4041110Ch	4	Inbound Inter Processor Message 12 From PMC To ISH (HOST2ISH_MSG12_PMC)	00000000h
40411110h	4	Inbound Inter Processor Message 13 From PMC To ISH (HOST2ISH_MSG13_PMC)	00000000h
40411114h	4	Inbound Inter Processor Message 14 From PMC To ISH (HOST2ISH_MSG14_PMC)	00000000h
40411118h	4	Inbound Inter Processor Message 15 From PMC To ISH (HOST2ISH_MSG15_PMC)	00000000h
4041111Ch	4	Inbound Inter Processor Message 16 From PMC To ISH (HOST2ISH_MSG16_PMC)	00000000h
40411120h	4	Inbound Inter Processor Message 17 From PMC To ISH (HOST2ISH_MSG17_PMC)	00000000h
40411124h	4	Inbound Inter Processor Message 18 From PMC To ISH (HOST2ISH_MSG18_PMC)	00000000h
40411128h	4	Inbound Inter Processor Message 19 From PMC To ISH (HOST2ISH_MSG19_PMC)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
4041112Ch	4	Inbound Inter Processor Message 20 From PMC To ISH (HOST2ISH_MSG20_PMC)	00000000h
40411130h	4	Inbound Inter Processor Message 21 From PMC To ISH (HOST2ISH_MSG21_PMC)	00000000h
40411134h	4	Inbound Inter Processor Message 22 From PMC To ISH (HOST2ISH_MSG22_PMC)	00000000h
40411138h	4	Inbound Inter Processor Message 23 From PMC To ISH (HOST2ISH_MSG23_PMC)	00000000h
4041113Ch	4	Inbound Inter Processor Message 24 From PMC To ISH (HOST2ISH_MSG24_PMC)	00000000h
40411140h	4	Inbound Inter Processor Message 25 From PMC To ISH (HOST2ISH_MSG25_PMC)	00000000h
40411144h	4	Inbound Inter Processor Message 26 From PMC To ISH (HOST2ISH_MSG26_PMC)	00000000h
40411148h	4	Inbound Inter Processor Message 27 From PMC To ISH (HOST2ISH_MSG27_PMC)	00000000h
4041114Ch	4	Inbound Inter Processor Message 28 From PMC To ISH (HOST2ISH_MSG28_PMC)	00000000h
40411150h	4	Inbound Inter Processor Message 29 From PMC To ISH (HOST2ISH_MSG29_PMC)	00000000h
40411154h	4	Inbound Inter Processor Message 30 From PMC To ISH (HOST2ISH_MSG30_PMC)	00000000h
40411158h	4	Inbound Inter Processor Message 31 From PMC To ISH (HOST2ISH_MSG31_PMC)	00000000h
4041115Ch	4	Inbound Inter Processor Message 32 From PMC To ISH (HOST2ISH_MSG32_PMC)	00000000h
40411378h	4	ISH IPC Busy Clear For PMC (ISH_IPC_BUSY_CLEAR_PMC)	00000000h
404116D4h	4	PMC To ISH Control And Status (PMC2ISH_CSR_PMC)	00000000h

#### 14.4.2.1 Peripheral Interrupt Status - PMC (PISR\_PMC) — Offset 40411000h

This register contains the inbound interrupt status bits for the PMC IPC channel. Interrupts are generated when PISR[x] & PIMR[x] are both set.

Type	Size	Offset	Default
MMIO	32 bit	40411000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved</b>
27	0h RW/1C	<b>PISR_H2IBCISC:</b> Host2ISH busy clear interrupt status clear interrupt: 1 -> Interrupt is active 0 -> Interrupt is inactive. Writing 1 to this bit clears it.
26:1	0h RO	<b>Reserved</b>
0	0h RO	<b>PISR_HOST2ISH:</b> Inbound IPC request from HOST to ISH status: 1 -> Interrupt is active 0 -> Interrupt is inactive.

#### 14.4.2.2 Peripheral Interrupt Mask - PMC (PIMR\_PMC) — Offset 40411004h

This register enables or disables Inbound interrupts from PMC to ISH. This register is not accessible by PMC.

Type	Size	Offset	Default
MMIO	32 bit	40411004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved</b>
27	0h RW	<b>H2IBCISC_IE:</b> Mask bit for H2IBCISC interrupt mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
26:12	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	<b>PIMR_ISH2HOST_BUSY_CLEAR:</b> Mask bit for ISH2HOST busy clear interrupt 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
10:1	0h RO	<b>Reserved</b>
0	0h RW	<b>PIMR_HOST2ISH:</b> Reserved

#### 14.4.2.3 PMC Peripheral Interrupt Mask (HOST\_PIMR\_PMC) — Offset 40411008h

This register is for enabling the interrupts generated by ISH towards PMC.

Type	Size	Offset	Default
MMIO	32 bit	40411008h	00000101h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	1h NA	<b>PIMR_HOST2ISH_BUSY_CLEAR:</b> Host2ISH busy clear interrupt mask bit 1 -> Interrupt is unmasked 0 -> Interrupt is masked.
7:1	0h RO	<b>Reserved</b>
0	1h NA	<b>PIMR_ISH2HOST_IPC_REG:</b> Outbound IPC request from ISH to HOST Mask 1 -> Interrupt is unmasked 0 -> Interrupt is masked.

#### 14.4.2.4 PMC Peripheral Interrupt Status (HOST\_PISR\_PMC) — Offset 4041100Ch

Interrupt status register for interrupts to PMC.

Type	Size	Offset	Default
MMIO	32 bit	4041100Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h NA	<b>PISR_HOST2ISH_BUSY_CLEAR:</b> Host2ISH busy clear interrupt status bit 1 -> Interrupt is active.
7:1	0h RO	<b>Reserved</b>
0	0h NA	<b>PISR_ISH2HOST_IPC_REG:</b> Outbound IPC request from ISH to HOST Status 1 -> Interrupt.

#### 14.4.2.5 PMC Channel Interrupt Mask (CIM\_PMC) – Offset 40411010h

This register is for masking the per channel interrupt, caused by any of the interrupt sources towards mIA in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	40411010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>CH_INTR_MASK:</b> Enable interrupts towards MIA for the channel. 1 -> Interrupt is masked 0 -> Interrupt is enabled.

#### 14.4.2.6 PMC Channel Interrupt Status (CIS\_PMC) – Offset 40411014h

This register provides the per channel interrupt status, this is set if any of the interrupt sources towards mIA are set in the IPC Channel.

Type	Size	Offset	Default
MMIO	32 bit	40411014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO	<b>CH_INTR_STATUS:</b> Interrupt status for the interrupts to MIA for the channel. This will be set if any of the interrupt sources are enabled and their status is high.

#### 14.4.2.7 Inbound DoorbellIPMC To ISH (HOST2ISH\_DOORBELL\_PMC) – Offset 40411048h

Inbound doorbell register, from PMC core to interrupt ISH. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. When software writes the message in to respective message register, it should set bit 31(BUSY Bit) of doorbell register to indicate that new data is written. The ISH will assert a level sensitive interrupt to the IOAPIC as long as the BUSY bit is set. When the ISH reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	40411048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>BUSY:</b> When this bit is cleared, the ISH CPU is Ready to accept a new message.
30:0	00000000h RW	<b>PAYOUTLOAD_31BIT:</b> 31bits message payload for backward compatibility.

#### 14.4.2.8 Outbound DoorbellISH To PMC (ISH2HOST\_DOORBELL\_PMC) – Offset 40411054h

Outbound doorbell register for the ISH to interrupt PMC. Setting bit 31 of this register causes the Host to receive a IRQn interrupt. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or

256bit payload registers. The ISH will set bit 31 of this reg to ring the doorbell after it has completed programming the message to Host. When the Host reads the message code from this register it should write back to this register and clear the BUSY bit.

Type	Size	Offset	Default
MMIO	32 bit	40411054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>BUSY:</b> When this bit is cleared, the HOST CPU is Ready to accept a new message.
30:0	00000000h RW	<b>PAYLOAD_31BIT:</b> 31bits message payload for backward compatibility.

#### 14.4.2.9 Inbound Inter Processor Message 1 From PMC To ISH (HOST2ISH\_MSG1\_PMC) — Offset 404110E0h

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Type	Size	Offset	Default
MMIO	32 bit	404110E0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>MSG:</b> Message from PMC to ISH.

#### **14.4.2.10 Inbound Inter Processor Message 2 From PMC To ISH (HOST2ISH\_MSG2\_PMC) – Offset 404110E4h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.11 Inbound Inter Processor Message 3 From PMC To ISH (HOST2ISH\_MSG3\_PMC) – Offset 404110E8h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.12 Inbound Inter Processor Message 4 From PMC To ISH (HOST2ISH\_MSG4\_PMC) – Offset 404110EC<sub>h</sub>**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.13 Inbound Inter Processor Message 5 From PMC To ISH (HOST2ISH\_MSG5\_PMC) – Offset 404110F0<sub>h</sub>**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.14 Inbound Inter Processor Message 6 From PMC To ISH (HOST2ISH\_MSG6\_PMC) – Offset 404110F4<sub>h</sub>**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.15 Inbound Inter Processor Message 7 From PMC To ISH (HOST2ISH\_MSG7\_PMC) — Offset 404110F8h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.16 Inbound Inter Processor Message 8 From PMC To ISH (HOST2ISH\_MSG8\_PMC) — Offset 404110FCCh**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.17 Inbound Inter Processor Message 9 From PMC To ISH (HOST2ISH\_MSG9\_PMC) — Offset 40411100h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.18 Inbound Inter Processor Message 10 From PMC To ISH (HOST2ISH\_MSG10\_PMC) — Offset 40411104h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.19 Inbound Inter Processor Message 11 From PMC To ISH (HOST2ISH\_MSG11\_PMC) — Offset 40411108h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.20 Inbound Inter Processor Message 12 From PMC To ISH (HOST2ISH\_MSG12\_PMC) — Offset 4041110Ch**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.21 Inbound Inter Processor Message 13 From PMC To ISH (HOST2ISH\_MSG13\_PMC) — Offset 40411110h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.22 Inbound Inter Processor Message 14 From PMC To ISH (HOST2ISH\_MSG14\_PMC) — Offset 40411114h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.23 Inbound Inter Processor Message 15 From PMC To ISH (HOST2ISH\_MSG15\_PMC) — Offset 40411118h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.24 Inbound Inter Processor Message 16 From PMC To ISH (HOST2ISH\_MSG16\_PMC) — Offset 4041111Ch**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.25 Inbound Inter Processor Message 17 From PMC To ISH (HOST2ISH\_MSG17\_PMC) – Offset 40411120h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.26 Inbound Inter Processor Message 18 From PMC To ISH (HOST2ISH\_MSG18\_PMC) – Offset 40411124h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.27 Inbound Inter Processor Message 19 From PMC To ISH (HOST2ISH\_MSG19\_PMC) – Offset 40411128h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.28 Inbound Inter Processor Message 20 From PMC To ISH (HOST2ISH\_MSG20\_PMC) – Offset 4041112Ch**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.29 Inbound Inter Processor Message 21 From PMC To ISH (HOST2ISH\_MSG21\_PMC) – Offset 40411130h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.30 Inbound Inter Processor Message 22 From PMC To ISH (HOST2ISH\_MSG22\_PMC) — Offset 40411134h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.31 Inbound Inter Processor Message 23 From PMC To ISH (HOST2ISH\_MSG23\_PMC) — Offset 40411138h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.32 Inbound Inter Processor Message 24 From PMC To ISH (HOST2ISH\_MSG24\_PMC) — Offset 4041113Ch**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.33 Inbound Inter Processor Message 25 From PMC To ISH (HOST2ISH\_MSG25\_PMC) — Offset 40411140h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.34 Inbound Inter Processor Message 26 From PMC To ISH (HOST2ISH\_MSG26\_PMC) — Offset 40411144h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.35 Inbound Inter Processor Message 27 From PMC To ISH (HOST2ISH\_MSG27\_PMC) – Offset 40411148h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.36 Inbound Inter Processor Message 28 From PMC To ISH (HOST2ISH\_MSG28\_PMC) – Offset 4041114Ch**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.37 Inbound Inter Processor Message 29 From PMC To ISH (HOST2ISH\_MSG29\_PMC) – Offset 40411150h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.38 Inbound Inter Processor Message 30 From PMC To ISH (HOST2ISH\_MSG30\_PMC) – Offset 40411154h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### **14.4.2.39 Inbound Inter Processor Message 31 From PMC To ISH (HOST2ISH\_MSG31\_PMC) – Offset 40411158h**

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### 14.4.2.40 Inbound Inter Processor Message 32 From PMC To ISH (HOST2ISH\_MSG32\_PMC) – Offset 4041115Ch

Inter-process Message registers for PMC to communicate to the ISH. These are eight 32bit registers that hold the message payload from PMC to ISH. These registers are meant to be written by PMC and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

**Note:** Bit definitions are the same as HOST2ISH\_MSG1\_PMC, offset 404110E0h.

#### 14.4.2.41 ISH IPC Busy Clear For PMC (ISH\_IPC\_BUSY\_CLEAR\_PMC) – Offset 40411378h

This register holds the status of the ISH IPC busy clear interrupts. ISH IPC busy clear interrupt is set when busy bit of respective outbound doorbell register gets cleared and interrupt is cleared when ISH writes 1 to respective bit in ISH IPC busy clear register.

Type	Size	Offset	Default
MMIO	32 bit	40411378h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW/1C	<b>ISH2HOST_BUSY_CLEAR:</b> Busy clear interrupt bit of ISH2HOST IPC 1 -> Interrupt active 0 -> Interrupt inactive.

#### 14.4.2.42 PMC To ISH Control And Status (PMC2ISH\_CSR\_PMC) – Offset 404116D4h

This is a control and status register for enabling PMC to interrupt mIA by setting any of the bits of the register. The Interrupt is then cleared by mIA by writing 1 b1 to this register after the appropriate ISR is serviced. The definitions of these bits are defined by the software.

Type	Size	Offset	Default
MMIO	32 bit	404116D4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	<b>Control Status (CSR):</b> Control and status information transfer between ISH and PMC Fws and interrupt generation to mIA.

## 14.5 PMU Registers

PMU Registers	Address Offset	Table
PMU	40500000h - 40500F40h	Table 13-15

## 14.5.1 PMU Registers Summary

**Table 14-15. Summary of PMU Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40500000h	4	SRAM Bank Power Gate Enable (PMU_SRAM_PG_EN)	03FFFFFFh
40500010h	4	Wake Mask-1 (PMU_ISH_MASK_EVENT)	00000000h
40500018h	4	Fabric Idle And Time Out Count Configuration (PMU_ISH_FABRIC_CNT)	3A980008h
4050001Ch	4	Glitch Bypass Enable (PMU_ISH_GLITCH_BYPASS)	00000001h
40500020h	4	RF And ROM Clock Gate To Isolation Enable Count. (PMU_RF_ROM_CLKGATE_TO_ISOEN_CTRL)	00000002h
40500024h	4	RF And ROM Isolation Enable To Power Gate Count. (PMU_RF_ROM_ISOEN_TO_PWRGATE_CTRL)	00000002h
40500028h	4	RF And ROM Power Ungate To Isolation Disable Count (PMU_RF_ROM_PWRUNGATE_TO_ISODIS_CTRL)	00000002h
4050002Ch	4	RF And ROM Isolation Disable To Clock Gate Exit Count (PMU_RF_ROM_ISODIS_TO_CLKGATEEXIT_CTRL)	00000002h
40500030h	4	RF And ROM Power Gating Control (PMU_RF_ROM_PWR_CTRL)	00000000h
40500034h	4	SRAM Isolation Disable To Idle Count (PMU_SRAM_PWR_CTRL)	0F0F0F02h
4050003Ch	4	VNN Req Assert (PMU_VNN_REQ_31_0)	00000000h
40500040h	4	Vnn_req/Ack Live Status, Interrupts And Interrupt Masks Record (PMU_VNN_REQ_ACK)	00000000h
4050004Ch	4	Wake Mask-2 (PMU_ISH_MASK_EVENT2)	000FFC00h
40500054h	4	PGCB Clock Gating Control (PMU_PGCB_CLK_GATE_CTRL)	00000100h
40500058h	4	Vnnaon Reduction Enable (PMU_VNNAON_RED_EN)	00000000h
4050005Ch	4	Reset Prep (PMU_RESET_PREP_REG)	00000000h
40500060h	4	Fabric Idle Time Out Snapshot (PMU_FABRIC_SNAPSHOT_REG)	00000000h
40500064h	4	Context Propagation Enable (PMU_CP_EN_REG)	00000000h
40500068h	4	Clock Gating And Power Gating Status (PMU(CG PG STATUS REG)	00000000h
4050006Ch	4	VNN Req Assert (PMU_VNN_REQ_63_32)	00000000h
40500070h	4	Host Wake (PMU_HOST_WAKEUP_0)	00000000h
40500074h	4	Host Wake (PMU_HOST_WAKEUP_1)	00000000h
40500078h	4	PME Status Clear Interrupt Mask (PMU_STATUS_CLR_INTR_MSK_0)	00000000h
4050007Ch	4	PME Status Clear Interrupt Mask (PMU_STATUS_CLR_INTR_MSK_1)	00000000h
40500080h	4	PME Status Clear Interrupt Status (PMU_PME_STATUS_CLR_INTR_STS_0)	00000000h
40500084h	4	PME Status Clear Interrupt Status (PMU_PME_STATUS_CLR_INTR_STS_1)	00000000h
40500088h	4	PME Live Status (PMC_STS_SHADOW_0)	00000000h
4050008Ch	4	PME Live Status (PMC_STS_SHADOW_1)	00000000h
40500100h	4	PCE ShadowFor PCI Function 0 (PCE_STATUS_0)	00000000h
40500104h	4	PCE ShadowFor PCI Function 1 (PCE_STATUS_1)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40500108h	4	PCE ShadowFor PCI Function 2 (PCE_STATUS_2)	00000000h
4050010Ch	4	PCE ShadowFor PCI Function 3 (PCE_STATUS_3)	00000000h
40500110h	4	PCE ShadowFor PCI Function 4 (PCE_STATUS_4)	00000000h
40500114h	4	PCE ShadowFor PCI Function 5 (PCE_STATUS_5)	00000000h
40500118h	4	PCE ShadowFor PCI Function 6 (PCE_STATUS_6)	00000000h
4050011Ch	4	PCE ShadowFor PCI Function 7 (PCE_STATUS_7)	00000000h
40500120h	4	PCE ShadowFor PCI Function 8 (PCE_STATUS_8)	00000000h
40500124h	4	PCE ShadowFor PCI Function 9 (PCE_STATUS_9)	00000000h
40500128h	4	PCE ShadowFor PCI Function 10 (PCE_STATUS_10)	00000000h
4050012Ch	4	PCE ShadowFor PCI Function 11 (PCE_STATUS_11)	00000000h
40500130h	4	PCE ShadowFor PCI Function 12 (PCE_STATUS_12)	00000000h
40500134h	4	PCE ShadowFor PCI Function 13 (PCE_STATUS_13)	00000000h
40500138h	4	PCE ShadowFor PCI Function 14 (PCE_STATUS_14)	00000000h
4050013Ch	4	PCE ShadowFor PCI Function 15 (PCE_STATUS_15)	00000000h
40500140h	4	PCE ShadowFor PCI Function 16 (PCE_STATUS_16)	00000000h
40500144h	4	PCE ShadowFor PCI Function 17 (PCE_STATUS_17)	00000000h
40500148h	4	PCE ShadowFor PCI Function 18 (PCE_STATUS_18)	00000000h
4050014Ch	4	PCE ShadowFor PCI Function 19 (PCE_STATUS_19)	00000000h
40500150h	4	PCE ShadowFor PCI Function 20 (PCE_STATUS_20)	00000000h
40500154h	4	PCE ShadowFor PCI Function 21 (PCE_STATUS_21)	00000000h
40500158h	4	PCE ShadowFor PCI Function 22 (PCE_STATUS_22)	00000000h

17	0h RW	<b>Host IPC Wake Mask 1-Mask Wake From IPC 0-No Mask For Wake From IPC (MASK_HOST_IPC_INTERRUPTS):</b> Masks Host IPC interrupts 1-Mask Wake from IPC 0-No mask for wake from IPC.
16	0h RW	<b>HPET Timer Wake Mask 1-Mask Wake From Timer Event 0-No Mask For Wake From Timer Event (MASK_TIMER_WAKE_INTERRUPTS):</b> Masks Timer wake interrupts 1-Mask Wake from Timer event 0-No mask for wake from Timer event.
15:0	0h RO	<b>Reserved</b>

#### 14.5.1.3 Fabric Idle And Time Out Count Configuration (PMU\_ISH\_FABRIC\_CNT) — Offset 40500018h

This register stores the value of Idle count and time out count used by Func clock gate FSM during WAIT state to detect fabric idle condition and time out condition respectively.

Type	Size	Offset	Default
MMIO	32 bit	40500018h	3A980008h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	3A98h RW	<b>Time Out Value For PMU Fabric Timeout Counter (PMU_FABRIC_TIMEOUT_CNT):</b> Timeout value for PMU Fabric timeout counter.
15:0	0008h RW	<b>Value For The Idle Counter 0 - 16 (PMU_FABRIC_IDLE_CNT):</b> Count value for the idle counter 0 - 16.

#### 14.5.1.4 Glitch Bypass Enable (PMU\_ISH\_GLITCH\_BYPASS) — Offset 4050001Ch

This register is used to enable/disable glitch bypass circuit inside the PM for all the GPIO input signals.

Type	Size	Offset	Default
MMIO	32 bit	4050001Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	1h RW	<b>Glitch Bypass Enable Bit (GLITCH_BYPASS):</b> This bit is used to enable glitch filter logic in PMU. 0 Do not bypass glitch filter 1 Bypass Glitch filter.

#### 14.5.1.5 RF And ROM Clock Gate To Isolation Enable Count. (PMU\_RF\_ROM\_CLKGATE\_TO\_ISOEN\_CTRL) — Offset 40500020h

This register is used by FW to program the count value for the number of clocks between CLKGATE state and ISOEN state in func clkgate fsm.

Type	Size	Offset	Default
MMIO	32 bit	40500020h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0002h RW	<b>ClkGate To ISOEN Count (CLKGATE_TO_ISOEN_COUNTER):</b> Count value for ClkGate to ISOEN state 0-16.

#### 14.5.1.6 RF And ROM Isolation Enable To Power Gate Count. (PMU\_RF\_ROM\_ISOEN\_TO\_PWRGATE\_CTRL) — Offset 40500024h

This register is used by FW to program the count value for the number of clocks between ISOEN and PWRGATE state in func clkgate fsm.

Type	Size	Offset	Default
MMIO	32 bit	40500024h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0002h RW	<b>ISOEN To PWRGATE Count (ISOEN_TO_PWRGATE_COUNTER):</b> Count value for ISOEN to PWRGATE state 0-16.

#### 14.5.1.7 RF And ROM Power Ungate To Isolation Disable Count (PMU\_RF\_ROM\_PWRUNGATE\_TO\_ISODIS\_CTRL) — Offset 40500028h

This register is used by FW to program the count value for the number of clocks between PWRUNGATE and ISODIS states of func clock gate FSM.

Type	Size	Offset	Default
MMIO	32 bit	40500028h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0002h RW	<b>PWRUNGATE To ISODIS Count (PWRUNGATE_TO_ISODIS_COUNTER):</b> Count value for PWRUNGATE to ISODIS state 0-16.

#### 14.5.1.8 RF And ROM Isolation Disable To Clock Gate Exit Count (PMU\_RF\_ROM\_ISODIS\_TO\_CLKGATEEXIT\_CTRL) — Offset 4050002Ch

This register is used by FW to program the count value for the number of clocks between PWRUNGATE and ISODIS states of func clock gate FSM.

Type	Size	Offset	Default
MMIO	32 bit	4050002Ch	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0002h RW	<b>ISODIS To CLKGATEEXIT Count (ISODIS_TO_CLKGATEEXIT_COUNTER):</b> Count value for ISODIS to CLKGATEEXIT state 0-16.

#### 14.5.1.9 RF And ROM Power Gating Control (PMU\_RF\_ROM\_PWR\_CTRL) — Offset 40500030h

This register is used by FW to enable power gating of RF (Cache and other IP RFs).

Type	Size	Offset	Default
MMIO	32 bit	40500030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>AON RF DeepsleepEnable 1-Enable AON_RF Deepsleep Mode 0-Disable AONRF Deepsleep Mode (AONRF_DEEPSLEEP_EN):</b> AONRF Deepsleep mode enable 1-AONRF enters deepsleep mode when firewall enable is high 0-AONRF deepsleep mode is disabled.
0	0h RW	<b>RF And ROM Power Gating Enable 1-RF ROM Power Gating Enable 0-RF ROM Power Gating Disable (RF_ROM_POWER_GATING_ENABLE):</b> RF ROM power gating enable 1-RF ROM power gating enable 0-RF ROM power gating disable.

#### 14.5.1.10 SRAM Isolation Disable To Idle Count (PMU\_SRAM\_PWR\_CTRL) – Offset 40500034h

This register is used by FW to program the count value for the number of clocks between ISODIS and IDLE states of SRAM PG FSM.

Type	Size	Offset	Default
MMIO	32 bit	40500034h	0F0F0F02h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved</b>
27:24	Fh RW	<b>SRAM ISODIS To IDLE Count (SRAM_ISODIS_TO_IDLE_COUNTER_):</b> Count value for SRAM ISODIS to IDLE state 0-3.
23:20	0h RO	<b>Reserved</b>
19:16	Fh RW	<b>SRAM POWERUNGATE To ISODIS Count (SRAM_POWERUNGATE_TO_ISODIS_COUNTER):</b> Count value for SRAM POWERUNGATE to ISODIS state 0-3.
15:12	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
11:8	Fh RW	<b>SRAM POWERGATE To POWERUNGATE Count (SRAM_POWERGATE_TO_POWERUNGATE_COUNTER):</b> Count value for SRAM POWERGATE to POWERUNGATE state 0-3.
7:4	0h RO	<b>Reserved</b>
3:0	2h RW	<b>SRAM ISOEN To POWERGATE Count (SRAM_ISOEN_TO_POWERGATE_COUNTER):</b> Count value for SRAM ISOEN to POWERGATE state 0-3.

#### 14.5.1.11 VNN Req Assert (PMU\_VNN\_REQ\_31\_0) — Offset 4050003Ch

This register is used by ISH FW to assert ish\_pmc\_vnn\_req indication towards PMC.

Type	Size	Offset	Default
MMIO	32 bit	4050003Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/ 1C/V	<b>Vnn_req Assert Bit 31 (VNN_REQ_31_0_31):</b> Vnn_req bit31. 1-vnn_req set 0-vnn_req reset.

#### 14.5.1.14 PGCB Clock Gating Control (PMU\_PGCB\_CLK\_GATE\_CTRL) — Offset 40500054h

This register is used by FW to program the IP-accessible clock gating disable as well as the count value for the T\_CLKGATE hysteresis timer for the PGCB clock.

Type	Size	Offset	Default
MMIO	32 bit	40500054h	00000100h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	1h RW	<b>Accessible Clock Gate Disable Bit For PGCB Clock (ACC_CLKGATE_DISABLED):</b> This bit is a disable for clock gating PGCB clock during IP-accessible flow. 1-ClkGating disabled for Acc. flow 0-ClkGating enabled for Acc. Flow.
7:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>T_CLKGATE Count Value (T_CLKGATE_TIMER_VALUE):</b> Count value for T_CLKGATE state 0-16. This is used to load the hysteresis timer in the PCGU.

#### 14.5.1.15 Vnnaon Reduction Enable (PMU\_VNNAON\_RED\_EN) — Offset 40500058h

This register is used to enable the vnnaon reduction handshake by the AON clock gate FSM.

Type	Size	Offset	Default
MMIO	32 bit	40500058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW/AC	<b>VNNAON Reduction Enable (VNNAON_RED_EN):</b> This bit is used to enable VNNAON reduction feature. 1-VNNAON reduction enable 0-VNNAON reduction disable.

#### 14.5.1.16 Reset Prep (PMU\_RESET\_PREP\_REG) — Offset 4050005Ch

This register records the Reset Prep avail and the other associated messages for Reset Prep.

Type	Size	Offset	Default
MMIO	32 bit	4050005Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>Prep Avail Mask 1- Mask Reset Prep Avail Interrupt 0-Reset Prep Avail Interrupt Not Masked. (RESET_PREP_AVAIL_MASK):</b> Reset Prep Avail Mask 1- mask reset prep avail interrupt 0-reset prep avail interrupt not masked.

#### 14.5.1.17 Fabric Idle Time Out Snapshot (PMU\_FABRIC\_SNAPSHOT\_REG) – Offset 40500060h

This register indicates the snap shot of the idle indications when the fabric time out counter expires. This register indicates the cause for the ISH HW to fail enter D0ix state. Note that this is an interrupt cause vector for a PMU wake. This means that PMU Wake Handler must read this register on every wake event. This is used for debug purposes only, as this is to be never set, in good operational conditions.

Type	Size	Offset	Default
MMIO	32 bit	40500060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW/1C	<b>HPET Write InProgress Snapshot (PMU_HPET_WR_INPROGRESS_SNAPSHOT):</b> This bit is the snap shot of the HPET_REG_WR_InProgress signal from the HPET when Fabric time out counter expires.
4	0h RW/1C	<b>UART HSU Active Snapshot (PMU_HSU_ACTIVE_SNAPSHOT):</b> This bit is the snap shot of !hsu_idle signal when Fabric time out counter expires.
3	0h RW/1C	<b>OCP Fabric Active Snapshot (PMU_FABRIC_ACTIVE_SNAPSHOT):</b> This bit is the snap shot of the OR of all the pm_active_o indications from the OCP fabric when Fabric time out counter expires.
2	0h RW/1C	<b>Bridge OCP Active Snapshot (PMU_BR_OCP_ACTIVE_SNAPSHOT):</b> This bit is the snap shot of !iosf2ocp_idle signal when Fabric time out counter expires.
1	0h RW/1C	<b>Bridge Side Active Snapshot (PMU_BR_SIDE_ACTIVE_SNAPSHOT):</b> This bit is the snap shot of !iosf2ocp_sb_idle_funcclk_sync signal when Fabric time out counter expires.
0	0h RW/1C	<b>Bridge Prim Active Snapshot (PMU_BR_PRIM_ACTIVE_SNAPSHOT):</b> This bit is the snap shot of PwrActive_funcclk_sync (!iosf2ocp_pr_idle_funcclk_sync in chassis compliant SOCs) signal when Fabric time out counter expires.

#### 14.5.1.18 Context Propagation Enable (PMU\_CP\_EN\_REG) – Offset 40500064h

Context Propagation Enable Register. This register can be programmed by ISH FW to enable forcing the clock for context propagation during IP accessible exit.

Type	Size	Offset	Default
MMIO	32 bit	40500064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0000000h RO	<b>RSV:</b> Reserved
0	0h RW	<b>Force Clock For Context Propagation Enable (PMU_CP_EN):</b> This bit is routed to the SHIM module for forcing clocks to allow for context propagation during IP accessible PG exit. When this bit is set, the force clocks for context propagation will be enabled.

#### 14.5.1.19 Clock Gating And Power Gating Status (PMU(CG\_PG\_STATUS\_REG) – Offset 40500068h)

This register indicates the clock gating and power gating progress and status (PCR 1503884648). This can be used by FW to ensure that the clock gating and the power gating has happened as expected and specific states have been reached during the clock gating and power gating entry. FW is expected to clear this register after every exit to ensure the correct status is getting recorded during the next clock gate/power gate entry.

Type	Size	Offset	Default
MMIO	32 bit	40500068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	00000h RO	<b>RSV:</b> Reserved
12	0h RW/1C	<b>Successful AON Clk Gating Entry Achieved (PMU_AONCG_ENTRY_STATUS):</b> This bit is set as soon as the AON clkreq fsm enters clk_deassert state. Note: This bit will get set only after the exit happens as the functional clock is not running at the time the aon clk gating happens.
11	0h RW/1C	<b>Successful PowerGate Entry Achieved (PMU_PG_ENTRY_STATUS):</b> This bit is set as soon as the pg_ack from the PMC is asserted. Note: This bit will get set only after the exit happens as the functional clock is not running at the time the pg_ack from PMC gets asserted. Note: When this bit is set, both the logic and the memories (RF cache and ROM) are guaranteed to be power gated during IP accessible PG (Ref HSDES: 1603968289).

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/1C	<b>Successful PowerGate Ready Achieved For SBEP Side Clock Domain (PMU_PGREADY_SBEP_ENTRY_STATUS):</b> This bit is set as soon as CDC for Prim domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit may get set only after the exit happens as the functional clock is not running at the time the Prim CDC is asserting the PwrgateReady.
9	0h RW/1C	<b>Successful PowerGate Ready Achieved For Bridge Side Clock Domain (PMU_PGREADY_BRSIDE_ENTRY_STATUS):</b> This bit is set as soon as CDC for bridge side clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit may get set only after the exit happens as the functional clock may not be running at the time the bridge side CDC is asserting the PwrgateReady.
8	0h RW/1C	<b>Successful PowerGate Ready Achieved For Bridge Primary Clock Domain (PMU_PGREADY_BRPRIM_ENTRY_STATUS):</b> This bit is set as soon as CDC for bridge primary clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit may get set only after the exit happens as the functional clock may not be running at the time the Primary domain CDC is asserting the PwrgateReady.
7	0h RW/1C	<b>Successful PowerGate Ready Achieved For Functional Clock Domain (PMU_PGREADY_FUNC_ENTRY_STATUS):</b> This bit is set as soon as CDC for functional clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit will get set only after the exit happens as the functional clock is not running at the time the functional CDC is asserting the PwrgateReady.
6	0h RW/1C	<b>Successful PowerGate Ready Achieved For MIA Clock Domain (PMU_PGREADY_MIA_ENTRY_STATUS):</b> This bit is set as soon as CDC for MIA clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit will get set only after the exit happens as the MIA clock is not running at the time the MIA CDC is asserting the PwrgateReady.
5	0h RW/1C	<b>Successful PowerGate Ready Achieved For Xtal Clock Domain (PMU_PGREADY_XTAL_ENTRY_STATUS):</b> This bit is set as soon as CDC for xtal clock domain was able to enter assert the pwrgate_ready indication to the PGCB. Note: This bit will get set only after the exit happens as the xtal clock is not running at the time the xtal CDC is asserting the PwrgateReady.
4	0h RW/1C	<b>Successful Vnnaon Active Deassertion Entry Achieved (PMU_VNNAON_ACT_DEASRT_ENTRY_STATUS):</b> This bit is set as soon as FSM2 was able to enter Vnnaon_Deassert state. Note: This bit will get set only after the exit happens as the functional clock is not running when the FSM2 enters Vnnaon_Deassert state.
3	0h RW/1C	<b>Successful Trunk Clock Gate Entry Achieved (PMU_TCG_ENTRY_STATUS):</b> This bit is set as soon as FSM2 was able to enter Clkreq_Deassert state. Note: This bit will get set only after the exit happens as the functional clock is not running when the FSM2 enters clkreq_Deassert state.
2	0h RW/1C	<b>Successful RF And ROM ONLY Power Gate Entry Achieved (PMU_RF_ROM_PG_ENTRY_STATUS):</b> This bit is set as soon as FSM1 was able to enter PowerGate state and hence when the RF and ROM only are power gated by FSM1. Note: This big does not get set when the RF and ROM are power gated by the SHIM during IP accessible PG entry. (Ref HSDES: 1603968289).
1	0h RW/1C	<b>Clock Gating Abort Condition (PMU(CG_ABORT_STATUS):</b> This bit is set only when FSM 1 moved from WAIT => IDLE state.
0	0h RW/1C	<b>Successful Minute IA CG ONLY State Entry Achieved (PMU_MIA(CG_ENTRY_STATUS):</b> This bit indicates that the FSM 1 was able to enter Minute IA CG state and hence when Minute IA alone is clock gated. Note: This bit does not get set during TCG entry and IP accessible PG even though the Minute IA clock is expected to be gated during these states. (Ref HSDES: 1603968289).

#### 14.5.1.20 VNN Req Assert (PMU\_VNN\_REQ\_63\_32) — Offset 4050006Ch

This register is used by ISH FW to assert ish\_pmc\_vnn\_req indication towards PMC.

Type	Size	Offset	Default
MMIO	32 bit	4050006Ch	00000000h

3	0h RW	<b>BME Fall Wake Mask For PCI Function 3 (BME_FALL_INTR_MASK_3):</b> If set BME fall wake interrupt will be mask for PCI Function 3.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	<b>BME Fall Wake Mask For PCI Function 2 (BME_FALL_INTR_MASK_2):</b> If set BME fall wake interrupt will be mask for PCI Function 2.
1	0h RW	<b>BME Fall Wake Mask For PCI Function 1 (BME_FALL_INTR_MASK_1):</b> If set BME fall wake interrupt will be mask for PCI Function 1.
0	0h RW	<b>BME Fall Wake Mask For PCI Function 0 (BME_FALL_INTR_MASK_0):</b> If set BME fall wake interrupt will be mask for PCI Function 0.

#### 14.5.1.76 BME Fall Interrupt Wake Mask 1 (BME\_FALL\_INTR\_MASK\_REG\_1) – Offset 4050022Ch

This register is used to mask BME fall interrupt for each PCI function.

Type	Size	Offset	Default
MMIO	32 bit	4050022Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>BME Fall Wake Mask For PCI Function 35 To 32 (BME_FALL_INTR_MASK_35_32):</b> If set BME fall wake interrupt will be mask for PCI Function 35 to 32.

#### 14.5.1.77 BME Rise Interrupt Wake0 (BME\_RISE\_INTR\_REG\_0) – Offset 40500230h

This register is used to record BME rise interrupt for each PCI function.

Type	Size	Offset	Default
MMIO	32 bit	40500230h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	<b>BME Rise Wake Record For PCI Function 31 To 0 (BME_RISE_INTR_31_0):</b> BME rise wake interrupt record for PCI Function 31 to 0.

#### 14.5.1.78 BME Rise Interrupt Wake1 (BME\_RISE\_INTR\_REG\_1) — Offset 40500234h

This register is used to record BME rise interrupt for each PCI function.

Type	Size	Offset	Default
MMIO	32 bit	40500234h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW/1C	<b>BME Rise Wake Record For PCI Function 35 To 32 (BME_RISE_INTR_35_32):</b> BME rise wake interrupt record for PCI Function 35 to 32.

#### 14.5.1.79 BME Fall Interrupt Wake0 (BME\_FALL\_INTR\_REG\_0) — Offset 40500238h

This register is used to record BME fall interrupt for each PCI function.

Type	Size	Offset	Default
MMIO	32 bit	40500238h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	<b>BME Fall Wake Record For PCI Function 31 To 0 (BME_FALL_INTR_31_0):</b> BME fall wake interrupt record for PCI Function 31 to 0.

#### 14.5.1.80 BME Fall Interrupt Wake1 (BME\_FALL\_INTR\_REG\_1) — Offset 4050023Ch

This register is used to record BME fall interrupt for each PCI function.

Type	Size	Offset	Default
MMIO	32 bit	4050023Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW/1C	<b>BME Fall Wake Record For PCI Function 35 To 32 (BME_FALL_INTR_35_32):</b> BME fall wake interrupt record for PCI Function 35 to 32.

#### 14.5.1.81 Bridge D3 Interrupt Wake Mask 0 (D3\_INTR\_MASK\_REG\_0) – Offset 40500240h

This register is used to mask D3 interrupt for each PCI function.

Type	Size	Offset	Default
MMIO	32 bit	40500240h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>D3 Wake Mask For PCI Function 31 (D3_INTR_MASK_31):</b> If set D3 wake interrupt will be mask for PCI Function 31.
30	0h RW	<b>D3 Wake Mask For PCI Function 30 (D3_INTR_MASK_30):</b> If set D3 wake interrupt will be mask for PCI Function 30.
29	0h RW	<b>D3 Wake Mask For PCI Function 29 (D3_INTR_MASK_29):</b> If set D3 wake interrupt will be mask for PCI Function 29.
28	0h RW	<b>D3 Wake Mask For PCI Function 28 (D3_INTR_MASK_28):</b> If set D3 wake interrupt will be mask for PCI Function 28.
27	0h RW	<b>D3 Wake Mask For PCI Function 27 (D3_INTR_MASK_27):</b> If set D3 wake interrupt will be mask for PCI Function 27.
26	0h RW	<b>D3 Wake Mask For PCI Function 26 (D3_INTR_MASK_26):</b> If set D3 wake interrupt will be mask for PCI Function 26.
25	0h RW	<b>D3 Wake Mask For PCI Function 25 (D3_INTR_MASK_25):</b> If set D3 wake interrupt will be mask for PCI Function 25.
24	0h RW	<b>D3 Wake Mask For PCI Function 24 (D3_INTR_MASK_24):</b> If set D3 wake interrupt will be mask for PCI Function 24.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	<b>D3 Wake Mask For PCI Function 23 (D3_INTR_MASK_23):</b> If set D3 wake interrupt will be mask for PCI Function 23.
22	0h RW	<b>D3 Wake Mask For PCI Function 22 (D3_INTR_MASK_22):</b> If set D3 wake interrupt will be mask for PCI Function 22.
21	0h RW	<b>D3 Wake Mask For PCI Function 21 (D3_INTR_MASK_21):</b> If set D3 wake interrupt will be mask for PCI Function 21.
20	0h RW	<b>D3 Wake Mask For PCI Function 20 (D3_INTR_MASK_20):</b> If set D3 wake interrupt will be mask for PCI Function 20.
19	0h RW	<b>D3 Wake Mask For PCI Function 19 (D3_INTR_MASK_19):</b> If set D3 wake interrupt will be mask for PCI Function 19.
18	0h RW	<b>D3 Wake Mask For PCI Function 18 (D3_INTR_MASK_18):</b> If set D3 wake interrupt will be mask for PCI Function 18.

10	0h RW	<b>D3 Wake Mask For PCI Function 10 (D3_INTR_MASK_10):</b> If set D3 wake interrupt will be mask for PCI Function 10.
9	0h RW	<b>D3 Wake Mask For PCI Function 9 (D3_INTR_MASK_9):</b> If set D3 wake interrupt will be mask for PCI Function 9.
8	0h RW	<b>D3 Wake Mask For PCI Function 8 (D3_INTR_MASK_8):</b> If set D3 wake interrupt will be mask for PCI Function 8.
7	0h RW	<b>D3 Wake Mask For PCI Function 7 (D3_INTR_MASK_7):</b> If set D3 wake interrupt will be mask for PCI Function 7.
6	0h RW	<b>D3 Wake Mask For PCI Function 6 (D3_INTR_MASK_6):</b> If set D3 wake interrupt will be mask for PCI Function 6.
5	0h RW	<b>D3 Wake Mask For PCI Function 5 (D3_INTR_MASK_5):</b> If set D3 wake interrupt will be mask for PCI Function 5.
4	0h RW	<b>D3 Wake Mask For PCI Function 4 (D3_INTR_MASK_4):</b> If set D3 wake interrupt will be mask for PCI Function 4.
3	0h RW	<b>D3 Wake Mask For PCI Function 3 (D3_INTR_MASK_3):</b> If set D3 wake interrupt will be mask for PCI Function 3.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	<b>D3 Wake Mask For PCI Function 2 (D3_INTR_MASK_2):</b> If set D3 wake interrupt will be mask for PCI Function 2.
1	0h RW	<b>D3 Wake Mask For PCI Function 1 (D3_INTR_MASK_1):</b> If set D3 wake interrupt will be mask for PCI Function 1.
0	0h RW	<b>D3 Wake Mask For PCI Function 0 (D3_INTR_MASK_0):</b> If set D3 wake interrupt will be mask for PCI Function 0.

#### 14.5.1.82 Bridge D3 Interrupt Wake Mask 1 (D3\_INTR\_MASK\_REG\_1) – Offset 40500244h

This register is used to mask D3 interrupt for each PCI function.

Type	Size	Offset	Default
MMIO	32 bit	40500244h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>D3 Wake Mask For PCI Function 35 To 32 (D3_INTR_MASK_35_32):</b> If set D3 wake interrupt will be mask for PCI Function 35 to 32.

#### 14.5.1.83 Bridge D3 Interrupt Wake0 (D3\_INTR\_REG\_0) – Offset 40500248h

This register is used to record D3 interrupt for each PCI function.

Type	Size	Offset	Default
MMIO	32 bit	40500248h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	<b>D3 Wake Record For PCI Function 31 To 0 (D3_INTR_31_0):</b> D3 wake interrupt record for PCI Function 1.

#### 14.5.1.84 Bridge D3 Interrupt Wake1 (D3\_INTR\_REG\_1) — Offset 4050024Ch

This register is used to record D3 interrupt for each PCI function.

Type	Size	Offset	Default
MMIO	32 bit	4050024Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW/1C	<b>D3 Wake Record For PCI Function 35 To 32 (D3_INTR_35_32):</b> D3 wake interrupt record for PCI Function 35 to 32.

#### 14.5.1.85 GPIO Wake Mask0 (GPIO\_INTR\_WK\_MASK\_REG\_0) — Offset 40500250h

This register is used for masking the wakes from gpio pins [31:0].

Type	Size	Offset	Default
MMIO	32 bit	40500250h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GPIO Wake Mask For Register 0 (GPIO_WK_MSK_0_REG):</b> Setting this bit masks wake from the corresponding gpio_pin.

#### 14.5.1.86 GPIO Wake Mask1 (GPIO\_INTR\_WK\_MASK\_REG\_1) — Offset 40500254h

This register is used for masking the wakes from gpio pins [63:32].

Type	Size	Offset	Default
MMIO	32 bit	40500254h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GPIO Wake Mask For Register 1 (GPIO_WK_MSK_1_REG):</b> Setting this bit masks wake from the corresponding gpio_pin.

#### 14.5.1.87 GPIO Wake Mask2 (GPIO\_INTR\_WK\_MASK\_REG\_2) – Offset 40500258h

This register is used for masking the wakes from gpio pins [95:64].

Type	Size	Offset	Default
MMIO	32 bit	40500258h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GPIO Wake Mask For Register 2 (GPIO_WK_MSK_2_REG):</b> Setting this bit masks wake from the corresponding gpio_pin.

#### 14.5.1.88 GPIO Wake Mask3 (GPIO\_INTR\_WK\_MASK\_REG\_3) – Offset 4050025Ch

This register is used for masking the wakes from gpio pins [127:96].

Type	Size	Offset	Default
MMIO	32 bit	4050025Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GPIO Wake Mask For Register 3 (GPIO_WK_MSK_3_REG):</b> Setting this bit masks wake from the corresponding gpio_pin.

#### 14.5.1.89 GPIO Wake Interrupt Record 0 (GPIO\_INTR\_REG\_0) – Offset 40500270h

This register is used to record wake from GPIO.

Type	Size	Offset	Default
MMIO	32 bit	40500270h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	<b>GPIO Wake Record For GPIO_31 (GPIO_INTR_31):</b> GPIO wake interrupt record for GPIO_31.
30	0h RW/1C	<b>GPIO Wake Record For GPIO_30 (GPIO_INTR_30):</b> GPIO wake interrupt record for GPIO_30.
29	0h RW/1C	<b>GPIO Wake Record For GPIO_29 (GPIO_INTR_29):</b> GPIO wake interrupt record for GPIO_29.
28	0h RW/1C	<b>GPIO Wake Record For GPIO_28 (GPIO_INTR_28):</b> GPIO wake interrupt record for GPIO_28.
27	0h RW/1C	<b>GPIO Wake Record For GPIO_27 (GPIO_INTR_27):</b> GPIO wake interrupt record for GPIO_27.
26	0h RW/1C	<b>GPIO Wake Record For GPIO_26 (GPIO_INTR_26):</b> GPIO wake interrupt record for GPIO_26.
25	0h RW/1C	<b>GPIO Wake Record For GPIO_25 (GPIO_INTR_25):</b> GPIO wake interrupt record for GPIO_25.
24	0h RW/1C	<b>GPIO Wake Record For GPIO_24 (GPIO_INTR_24):</b> GPIO wake interrupt record for GPIO_24.
23	0h RW/1C	<b>GPIO Wake Record For GPIO_23 (GPIO_INTR_23):</b> GPIO wake interrupt record for GPIO_23.

Bit Range	Default & Access	Field Name (ID): Description
22	0h RW/1C	<b>GPIO Wake Record For GPIO_22 (GPIO_INTR_22):</b> GPIO wake interrupt record for GPIO_22.
21	0h RW/1C	<b>GPIO Wake Record For GPIO_21 (GPIO_INTR_21):</b> GPIO wake interrupt record for GPIO_21.
20	0h RW/1C	<b>GPIO Wake Record For GPIO_20 (GPIO_INTR_20):</b> GPIO wake interrupt record for GPIO_20.
19	0h RW/1C	<b>GPIO Wake Record For GPIO_19 (GPIO_INTR_19):</b> GPIO wake interrupt record for GPIO_19.
18	0h RW/1C	<b>GPIO Wake Record For GPIO_18 (GPIO_INTR_18):</b> GPIO wake interrupt record for GPIO_18.
17	0h RW/1C	<b>GPIO Wake Record For GPIO_17 (GPIO_INTR_17):</b> GPIO wake interrupt record for GPIO_17.
16	0h RW/1C	<b>GPIO Wake Record For GPIO_16 (GPIO_INTR_16):</b> GPIO wake interrupt record for GPIO_16.
15	0h RW/1C	<b>GPIO Wake Record For GPIO_15 (GPIO_INTR_15):</b> GPIO wake interrupt record for GPIO_15.
14	0h RW/1C	<b>GPIO Wake Record For GPIO_14 (GPIO_INTR_14):</b> GPIO wake interrupt record for GPIO_14.
13	0h RW/1C	<b>GPIO Wake Record For GPIO_13 (GPIO_INTR_13):</b> GPIO wake interrupt record for GPIO_13.
12	0h RW/1C	<b>GPIO Wake Record For GPIO_12 (GPIO_INTR_12):</b> GPIO wake interrupt record for GPIO_12.
11	0h RW/1C	<b>GPIO Wake Record For GPIO_11 (GPIO_INTR_11):</b> GPIO wake interrupt record for GPIO_11.
10	0h RW/1C	<b>GPIO Wake Record For GPIO_10 (GPIO_INTR_10):</b> GPIO wake interrupt record for GPIO_10.
9	0h RW/1C	<b>GPIO Wake Record For GPIO_9 (GPIO_INTR_9):</b> GPIO wake interrupt record for GPIO_9.
8	0h RW/1C	<b>GPIO Wake Record For GPIO_8 (GPIO_INTR_8):</b> GPIO wake interrupt record for GPIO_8.
7	0h RW/1C	<b>GPIO Wake Record For GPIO_7 (GPIO_INTR_7):</b> GPIO wake interrupt record for GPIO_7.
6	0h RW/1C	<b>GPIO Wake Record For GPIO_6 (GPIO_INTR_6):</b> GPIO wake interrupt record for GPIO_6.
5	0h RW/1C	<b>GPIO Wake Record For GPIO_5 (GPIO_INTR_5):</b> GPIO wake interrupt record for GPIO_5.
4	0h RW/1C	<b>GPIO Wake Record For GPIO_4 (GPIO_INTR_4):</b> GPIO wake interrupt record for GPIO_4.
3	0h RW/1C	<b>GPIO Wake Record For GPIO_3 (GPIO_INTR_3):</b> GPIO wake interrupt record for GPIO_3.
2	0h RW/1C	<b>GPIO Wake Record For GPIO_2 (GPIO_INTR_2):</b> GPIO wake interrupt record for GPIO_2.
1	0h RW/1C	<b>GPIO Wake Record For GPIO_1 (GPIO_INTR_1):</b> GPIO wake interrupt record for GPIO_1.
0	0h RW/1C	<b>GPIO Wake Record For GPIO_0 (GPIO_INTR_0):</b> GPIO wake interrupt record for GPIO_0.

#### 14.5.1.90 GPIO Wake Interrupt Record 1 (GPIO\_INTR\_REG\_1) — Offset 40500274h

This register is used to record wake from GPIO.

Type	Size	Offset	Default
MMIO	32 bit	40500274h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW/1C	<b>GPIO Wake Record For GPIO_63 To 36 (GPIO_INTR_63_36):</b> GPIO wake interrupt record for GPIO_63_36.
3	0h RW/1C	<b>GPIO Wake Record For GPIO_35 (I3C IBI Wake) (GPIO_INTR_35):</b> GPIO wake interrupt record for GPIO_35.
2	0h RW/1C	<b>GPIO Wake Record For GPIO_34 (UART2 CTS) (GPIO_INTR_34):</b> GPIO wake interrupt record for GPIO_34.
1	0h RW/1C	<b>GPIO Wake Record For GPIO_33 (UART1 CTS) (GPIO_INTR_33):</b> GPIO wake interrupt record for GPIO_33.
0	0h RW/1C	<b>GPIO Wake Record For GPIO_32 (UART0 CTS) (GPIO_INTR_32):</b> GPIO wake interrupt record for GPIO_32.

#### 14.5.1.91 GPIO Wake Interrupt Record 2 (GPIO\_INTR\_REG\_2) — Offset 40500278h

This register is used to record wake from GPIO.

Type	Size	Offset	Default
MMIO	32 bit	40500278h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	<b>GPIO Wake Record For GPIO_95 To 64 (GPIO_INTR_95_64):</b> GPIO wake interrupt record for GPIO_95_64.

### 14.5.1.92 GPIO Wake Interrupt Record 3 (GPIO\_INTR\_REG\_3) — Offset 4050027Ch

This register is used to record wake from GPIO.

Type	Size	Offset	Default
MMIO	32 bit	4050027Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	<b>GPIO Wake Record For GPIO_127 To 96 (GPIO_INTR_127_96):</b> GPIO wake interrupt record for GPIO_127_96.

### 14.5.1.93 PWM And I2S Wake Interrupt (I2S\_INTR\_REG) — Offset 40500290h

This register is used to record wake from I2S.

Type	Size	Offset	Default
MMIO	32 bit	40500290h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW/1C	<b>Wake Record Register For PWM_0 (PWM_INTR_0):</b> This will record wake interrupt from PWM_0.
7:0	0h RO	<b>Reserved</b>

### 14.5.1.94 I2S Interrupt Mask (I2S\_INTR\_MASK\_REG) — Offset 40500294h

This register is used to mask wake from I2S.

Type	Size	Offset	Default
MMIO	32 bit	40500294h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW	<b>Wake Mask For PWM_0 (PWM_INTR_MASK_0):</b> If set wake interrupt for PWM_0 will be masked.
7:0	0h RO	<b>Reserved</b>

#### 14.5.1.95 IETHERNET Wake Interrupt (ETHER\_INTR\_REG) — Offset 40500298h

This register is used to record wake from Ethernet.

Type	Size	Offset	Default
MMIO	32 bit	40500298h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	<b>Reserved</b>
17	0h RW/1C	<b>Wake Record Register For Canbus_1 (CANBUS_INTR_1):</b> This will record wake interrupt from Canbus_1.
16	0h RW/1C	<b>Wake Record Register For Canbus_0 (CANBUS_INTR_0):</b> This will record wake interrupt from Canbus_0.
15:0	0h RO	<b>Reserved</b>

#### 14.5.1.96 ETHERNET Interrupt Mask (ETHERNET\_INTR\_MASK\_REG) — Offset 4050029Ch

This register is used to mask wake from ETHERNET.

Type	Size	Offset	Default
MMIO	32 bit	4050029Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	<b>Reserved</b>
17	0h RW	<b>Wake Mask For CANBUS_1 (CANBUS_INTR_MASK_1):</b> If set wake interrupt for CANBUS_1 will be masked.
16	0h RW	<b>Wake Mask For CANBUS_0 (CANBUS_INTR_MASK_0):</b> If set wake interrupt for CANBUS_0 will be masked.
15:9	00h RO	<b>ETHERNET_INTR_MASK_12_15:</b> Reserved
8:0	0h RO	<b>Reserved</b>

#### 14.5.1.97 QEP Wake Interrupt (QEP\_INTR\_REG) — Offset 405002A0h

This register is used to record wake from QEP.

Type	Size	Offset	Default
MMIO	32 bit	405002A0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW/1C	<b>Wake Record Register For QEP_3 (QEP_INTR_3):</b> This will record wake interrupt from QEP_3.
2	0h RW/1C	<b>Wake Record Register For QEP_2 (QEP_INTR_2):</b> This will record wake interrupt from QEP_2.
1	0h RW/1C	<b>Wake Record Register For QEP_1 (QEP_INTR_1):</b> This will record wake interrupt from QEP_1.
0	0h RW/1C	<b>Wake Record Register For QEP_0 (QEP_INTR_0):</b> This will record wake interrupt from QEP_0.

#### 14.5.1.98 QEP Interrupt Mask (QEP\_INTR\_MASK\_REG) — Offset 405002A4h

This register is used to mask wake from QEP.

Type	Size	Offset	Default
MMIO	32 bit	405002A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW	<b>Wake Mask For ADC_0 (ADC_INTR_MASK_0):</b> If set wake interrupt for ADC_0 will be masked.
7:4	0h RO	<b>Reserved</b>
3	0h RW	<b>Wake Mask For QEP_3 (QEP_INTR_MASK_3):</b> If set wake interrupt for QEP_3 will be masked.
2	0h RW	<b>Wake Mask For QEP_2 (QEP_INTR_MASK_2):</b> If set wake interrupt for QEP_2 will be masked.
1	0h RW	<b>Wake Mask For QEP_1 (QEP_INTR_MASK_1):</b> If set wake interrupt for QEP_1 will be masked.
0	0h RW	<b>Wake Mask For QEP_0 (QEP_INTR_MASK_0):</b> If set wake interrupt for QEP_0 will be masked.

#### 14.5.1.99 PMU LART Update (ADR\_LART\_UPD\_REG) — Offset 405002A8h

This register enables the Local ART update as part of HH flow.

Type	Size	Offset	Default
MMIO	32 bit	405002A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	000000h RO	<b>PMU_LART_UPD_RSVD1:</b> Reserved
9	0h RW	<b>PMU LART Update Interrupt Mask (PMU_LART_UPD_INT_MASK):</b> The interrupt mask is set by FW to mask the LART update interrupt.
8	0h RW/1C	<b>PMU LART Update Interrupt Status (PMU_LART_UPD_INT):</b> The interrupt status is set when LART update is completed.
7:1	00h RO	<b>PMU_LART_UPD_RSVD0:</b> Reserved
0	0h RW	<b>PMU LART Update Enable (PMU_LART_UPD_EN):</b> When set , initiates the Local ART value update for LMT.

#### 14.5.1.100 ISH HOST DEV Interrupt (HOST\_DEV\_REG) — Offset 405002ACh

This register is used to record interrupt from host device.

Type	Size	Offset	Default
MMIO	32 bit	405002ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>HOST DEV Interrupt Mask (PMU_HOST_DEV_INT_MASK):</b> If set wake interrupt for HOST DEV will be masked.
0	0h RW/1C	<b>HOST DEV Interrupt (PMU_HOST_DEV_INT):</b> This will record interrupt from HOST DEV.

#### 14.5.1.101 PCI Interrupt0 (PCE\_INTR\_REG\_0) — Offset 405002B0h

Combined interrupt status for each PCI function. This register is RO for the FW to identify the function where the interrupt status is set.

Type	Size	Offset	Default
MMIO	32 bit	405002B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>PCI Interrupt Record For PCI_31_0 (PCE_INTR_31_0):</b> Combined PCI interrupt record for PCI_31_0.

#### 14.5.1.102 PCI Interrupt1 (PCE\_INTR\_REG\_1) – Offset 405002B4h

Combined interrupt status for each PCI function. This register is RO for the FW to identify the function where the interrupt status is set.

Type	Size	Offset	Default
MMIO	32 bit	405002B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RO	<b>PCI Interrupt Record For PCI_36_32 (PCE_INTR_36_32):</b> Combined PCI interrupt record for PCI_36_32.

#### 14.5.1.103 D0I3 Interrupt0 (ADR\_D0I3\_INTR\_0\_REG) – Offset 405002B8h

Status for individual D0i3 chip for each function.

Type	Size	Offset	Default
MMIO	32 bit	405002B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>D0i3 CIP Interrupt Status For PCI Function_31_0 (D0I3_INTR_0_STATUS):</b> D0i3 CIP interrupt status for PCI Function_31_0.

#### 14.5.1.104 D0i3 Interrupt1 (ADR\_D0I3\_INTR\_1\_REG) — Offset 405002BCh

Status for individual D0i3 cip for each function.

Type	Size	Offset	Default
MMIO	32 bit	405002BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW/V	<b>D0i3 CIP Interrupt Status For PCI Function_35_32 (D0I3_INTR_1_STATUS):</b> D0i3 CIP interrupt status for PCI Function_35_32.

#### 14.5.1.105 XTAL Clk Reg (PMU\_XTAL\_CLK\_REQ\_REG) — Offset 405002C0h

This register has the config bit for controlling ISH gclkreq for XTAL clk. This gclkreq goes to XTAL CDC to generate final XTAL clkreq. This register also contains Live status of gclkack for XTAL clk.

Type	Size	Offset	Default
MMIO	32 bit	405002C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RO	<b>PMU_XTAL_CLK_REQ_RSVDO:</b> Reserved
1	0h RO	<b>Live Status Of XTAL Gclkack (PMU_XTAL_CLK_ACK):</b> Live status of XTAL gclkack.
0	0h RW	<b>Config Bit For XTAL Gclkreq (PMU_XTAL_CLK_REQ):</b> Controls gclkreq for XTAL clk.

#### 14.5.1.106 PMU CLKOCK SWITCH INTR (PMU\_CLK\_SWITCH\_INTR) – Offset 405002C4h

This register is an interrupt to ARM to wakes it up after clock switching.

Type	Size	Offset	Default
MMIO	32 bit	405002C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>INTR_PMU_SWITCH_MASK:</b> Interrupt mask for clock switch interrupt.
0	0h RW/1C	<b>INTR_PMU_SWITCH:</b> This interrupt is set when clock switching is done. This wakes up ARM from WFI after clock switching.

#### 14.5.1.107 PMU VNNAON Metastability Fix Enable (PMU\_VNNAON\_METAFIX\_EN\_REG) – Offset 405002CCh

This register can be used to enable the fix for meta-stability issue found in the vnnaon\_reduction feature. By default the fix will be enabled and can be disabled only if there are any issues found with the fix.

Type	Size	Offset	Default
MMIO	32 bit	405002CCh	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000h RO	<b>PMU_VNNAON_METAFIX_EN_RSVD:</b> Reserved
1	0h RW	<b>PMU_IOAPIC_INTR_MODE:</b> PMU IOAPC interrupt mode register. It is a chicken bit to select between PMU interrupt from Tensilica and LMT. 0 - PMU interrupt from LMT, 1 - PMU interrupt from Tensilica .
0	1h RW	<b>Vnnaon Meta-Stability Fix Enable (PMU_VNNAON_METAFIX_EN):</b> When set, this bit will enable the meta-stability fix in vnnaon reduction logic.

#### 14.5.1.108 PLL Power Up Sequence (PLL\_PUSEQ\_REG) – Offset 405002D0h

This register can be used to enable the PLL (6GHz) clock.

Type	Size	Offset	Default
MMIO	32 bit	405002D0h	00020000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	000h RO	<b>PLL_PUSEQ_RSVD1:</b> Reserved
21	0h RO/V	<b>AFC Done Status (PMUREG_AFC_DONE):</b> Asserted high when Auto-Frequency calibration (AFC) of the VCO coarse-tuning capacitor bank is complete. Prior to lock, AFC must be completed, or afcovrdn must be asserted.
20	0h RO/V	<b>Suspend Acknowledgment (PMUREG_SUSPEND_ACK):</b> 1: PLLcore can be put in suspend state 0: PLLcore is not ready to be put in suspend state.
19:18	0h RO	<b>PLL_PUSEQ_RSVD2:</b> Reserved
17	1h RW	<b>PLL Isolation Enable (FWEN_B):</b> Active Low. To Control PLL Isoation.
16	0h RW	<b>CRI Version (CRI_VERSION):</b> CRI master handshaking config 0: Gen1 1: Gen2.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	<b>CRI Mode (CRI_MODE):</b> Non-CRI or CRI mode config signal 0 - Non CRI 1 - CRI.
14	0h RW	<b>125MHz Clock Divider Enable (CK125_EN):</b> If sets enable clock divider to generate the 125MHz clock from 6GHz PLL clock.
13	0h RW	<b>200MHz Clock Divider Enable (CK200_EN):</b> If sets enable clock divider to generate the 200MHz clock from 6GHz PLL clock.
12	0h RW	<b>400MHz Clock Divider Enable (CK400_EN):</b> If sets enable clock divider to generate the 400MHz clock from 6GHz PLL clock.
11	0h RW	<b>500MHz Clock Divider Enable (CK500_EN):</b> If sets enable clock divider to generate the 500MHz clock from 6GHz PLL clock.
10:5	00h RW	<b>Register Compensation Code (RCOMP):</b> Resistor compensation code, which by default is used to calibrate the internal CPR based bias generator. 0x28 nominal. The value corresponds to the number of 2022 Ohm CPR resistors required in parallel to equal 50 Ohms.
4	0h RW	<b>PLL Enable (PLL_EN):</b> If sets it enable the PLL.
3	0h RW	<b>Full Calibration Reset (FULL_CAL_RESET):</b> TDC calibration and AFC calibration reset signal, PLL will perform a full calibration after PLL is enabled if i_fullcalreset_l has transitioned from low to high since previous PLL calibration.
2	0h RW	<b>Suspend Request (SUSPEND_REQ):</b> Sleep enable for retention latches. When this bit is enabled, retention latches are configured to retain its state. Upon acknowledgement (pmureg_suspend_ack) from PLLcore, core power is shut down. Refclk will be available, until pmureg_suspend_ack status is sent back to common logic.
1	0h RW	<b>CRI Reset (CRI_RESET):</b> Reset for all of the registers in CRI slave unit. Active low.
0	0h RW	<b>DIV Reset (PLLDIV_RESET):</b> Divider reset. Active low.

#### 14.5.1.109 PLL INTR (PLL\_INT\_REG) — Offset 405002D4h

This register captures the live status, fall edge,rise edge interrupt status and mask bits for the pll lock and divided clocks valid indication from the PLL.

Type	Size	Offset	Default
MMIO	32 bit	405002D4h	098C6318h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved</b>
27	1h RW	<b>PLL Unlock Rise Interrupt Mask (PMU_PLL_UNLOCK_RISE_INTR_MSK):</b> Set this bit is to mask the interrupt generation when PLL unlock flag is asserted.
26	0h RW/V	<b>PLL Unlock Rise Interrupt (PMU_PLL_UNLOCK_RISE_INTR):</b> This is interrupt to indicate that PLL Unlock flag is asserted.
25	0h RO/V	<b>PLL Unlock Live Status (PMU_PLL_UNLOCK_LIVE):</b> This bit captures the live status of PLL Unlock flag.
24	1h RW	<b>500MHz Clock Valid Fall Interrupt Mask (PMU_PLL_CK500_VALID_FALL_INTR_MSK):</b> Set this bit to mask the interrupt generation when 500MHz clock valid is de-asserted.
23	1h RW	<b>500MHz Clock Valid Rise Interrupt Mask (PMU_PLL_CK500_VALID_RISE_INTR_MSK):</b> Set this bit to mask the interrupt generation when 500MHz clock valid is asserted.
22	0h RW/V	<b>500MHz Clock Valid Fall Interrupt (PMU_PLL_CK500_VALID_FALL_INTR):</b> This is interrupt to indicate that 500MHz clock valid is de-asserted.
21	0h RW/V	<b>500MHz Clock Valid Rise Interrupt (PMU_PLL_CK500_VALID_RISE_INTR):</b> This is interrupt to indicate that 500MHz clock valid is asserted.
20	0h RO/V	<b>500MHz Clock Valid Live Status (PMU_PLL_CK500_VALID_LIVE):</b> This bit captures the live status of 500MHz clock valid signal.
19	1h RW	<b>400MHz Clock Valid Fall Interrupt Mask (PMU_PLL_CK400_VALID_FALL_INTR_MSK):</b> Set this bit to mask the interrupt generation when 400MHz clock valid is de-asserted.
18	1h RW	<b>400MHz Clock Valid Rise Interrupt Mask (PMU_PLL_CK400_VALID_RISE_INTR_MSK):</b> Set this bit to mask the interrupt generation when 400MHz clock valid is asserted.
17	0h RW/V	<b>400MHz Clock Valid Fall Interrupt (PMU_PLL_CK400_VALID_FALL_INTR):</b> This is interrupt to indicate that 400MHz clock valid is de-asserted.
16	0h RW/V	<b>400MHz Clock Valid Rise Interrupt (PMU_PLL_CK400_VALID_RISE_INTR):</b> This is interrupt to indicate that 400MHz clock valid is asserted.
15	0h RW/V	<b>400MHz Clock Valid Live Status (PMU_PLL_CK400_VALID_LIVE):</b> This bit captures the live status of 400MHz clock valid signal.
14	1h RW	<b>200MHz Clock Valid Fall Interrupt Mask (PMU_PLL_CK200_VALID_FALL_INTR_MSK):</b> Set this bit to mask the interrupt generation when 200MHz clock valid is de-asserted.
13	1h RW	<b>200MHz Clock Valid Rise Interrupt Mask (PMU_PLL_CK200_VALID_RISE_INTR_MSK):</b> Set this bit to mask the interrupt generation when 200MHz clock valid is asserted.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW/V	<b>200MHz Clock Valid Fall Interrupt (PMU_PLL_CK200_VALID_FALL_INTR):</b> This is interrupt to indicate that 200MHz clock valid is de-asserted.
11	0h RW/V	<b>200MHz Clock Valid Rise Interrupt (PMU_PLL_CK200_VALID_RISE_INTR):</b> This is interrupt to indicate that 200MHz clock valid is asserted.
10	0h RO/V	<b>200MHz Clock Valid Live Status (PMU_PLL_CK200_VALID_LIVE):</b> This bit captures the live status of 200MHz clock valid signal.
9	1h RW	<b>125MHz Clock Valid Fall Interrupt Mask (PMU_PLL_CK125_VALID_FALL_INTR_MSK):</b> Set this bit to mask the interrupt generation when 125MHz clock valid is de-asserted.
8	1h RW	<b>125MHz Clock Valid Rise Interrupt Mask (PMU_PLL_CK125_VALID_RISE_INTR_MSK):</b> Set this bit to mask the interrupt generation when 125MHz clock valid is asserted.
7	0h RW/V	<b>125MHz Clock Valid Fall Interrupt (PMU_PLL_CK125_VALID_FALL_INTR):</b> This is interrupt to indicate that 125MHz clock valid is de-asserted.
6	0h RW/V	<b>125MHz Clock Valid Rise Interrupt (PMU_PLL_CK125_VALID_RISE_INTR):</b> This is interrupt to indicate that 125MHz clock valid is asserted.
5	0h RO/V	<b>125MHz Clock Valid Live Status (PMU_PLL_CK125_VALID_LIVE):</b> This bit captures the live status of 125MHz clock valid signal.
4	1h RW	<b>PLL Lock Fall Interrupt Mask (PMU_PLL_LOCK_FALL_INTR_MSK):</b> Set this bit to mask the interrupt generation when PLL lock is de-asserted.
3	1h RW	<b>PLL Lock Rise Interrupt Mask (PMU_PLL_LOCK_RISE_INTR_MSK):</b> Set this bit to mask the interrupt generation when PLL lock is asserted.
2	0h RW/V	<b>PLL Lock Fall Interrupt (PMU_PLL_LOCK_FALL_INTR):</b> This is interrupt to indicate that PLL Lock is de-asserted.
1	0h RW/V	<b>PLL Lock Rise Interrupt (PMU_PLL_LOCK_RISE_INTR):</b> This is interrupt to indicate that PLL Lock is asserted.
0	0h RO/V	<b>PLL Lock Live Status (PMU_PLL_LOCK_LIVE):</b> This bit captures the live status of PLL Lock.

#### 14.5.1.110 ISH UART IDLE Mask (ADR\_PMU\_UART\_IDLE\_MASK\_REG) — Offset 405002D8h

When set PMU does not look for uart idle condition to initiate low power flow.

Type	Size	Offset	Default
MMIO	32 bit	405002D8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>UART Mask Idle (PMU_UART_IDLE_MASK):</b> If set enable the mask for UART idle interrupt.

#### 14.5.1.111 PMU\_TCG\_EXIT\_INTR\_REG — Offset 405002DCh

PMU TCG EXIT Interrupt register.

Type	Size	Offset	Default
MMIO	32 bit	405002DCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>PMU TCG Exit Interrupt Exit Mask (PMU_TCG_EXIT_INTR_MASK):</b> If set enable the mask for PMU TCG exit interrupt.
0	0h RW/1C	<b>TCG Exit Interrupt (PMU_TCG_EXIT_INTR):</b> It records PMU the TCG exit interrupt.

#### 14.5.1.112 Address D3 Live Status0 (ADR\_D3\_STATUS\_0\_REG) — Offset 405002E0h

D3 live status for all 36 PCI functions.

Type	Size	Offset	Default
MMIO	32 bit	405002E0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>D3 Status (ADR_D3_STATUS_0):</b> D3 status register for PCI functions 31 to 0.

#### 14.5.1.113 Address D3 Live Status1 (ADR\_D3\_STATUS\_1\_REG) — Offset 405002E4h

D3 live status for all 36 PCI functions.

Type	Size	Offset	Default
MMIO	32 bit	405002E4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RO/V	<b>D3 Status (ADR_D3_STATUS_1):</b> D3 status register for PCI functions 36 to 32.

#### 14.5.1.114 D0i3 Bit2 Status0 (ADR\_D0I3\_BIT2\_STATUS\_0\_REG) — Offset 405002E8h

D0i3 live value from D0i3 MMIO block for all PCI functions.

Type	Size	Offset	Default
MMIO	32 bit	405002E8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>D0I3_BIT2_STATUS_0:</b> D0i3 BIT2 Status register for PCI functions 31 to 0.

#### 14.5.1.115 D0i3 Bit2 Status1 (ADR\_D0I3\_BIT2\_STATUS\_1\_REG) — Offset 405002ECh

D0i3 live value from D0i3 MMIO block for all PCI functions.

Type	Size	Offset	Default
MMIO	32 bit	405002ECh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RO/V	<b>D0I3 Bit2 Status (D0I3_BIT2_STATUS_1):</b> D0i3 BIT2 Status register for PCI functions 36 to 32.

#### 14.5.1.116 D0i3 Bit0 Status0 (ADR\_D0I3\_BIT0\_STATUS\_0\_REG) — Offset 405002F0h

When CIP bits per function(or it could be the live CIP value of that function) get sets, corresponding bits per function in this register also gets set to 1. FM will clear that bit by writing 1 to that particular function bit number. On clearing of this bit number PMU HW will assert the D0i3\_req for that particular function number.

Type	Size	Offset	Default
MMIO	32 bit	405002F0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>D0i3_BIT0_STATUS_0:</b> D0i3 BIT0 Status register for PCI functions 31 to 0.

#### 14.5.1.117 D0i3 Bit0 Status1 (ADR\_D0I3\_BIT0\_STATUS\_1\_REG) – Offset 405002F4h

When CIP bits per function(or it could be the live CIP value of that function) get sets, corresponding bits per function in this register also gets set to 1. FM will clear that bit by writing 1 to that particular function bit number. On clearing of this bit number PMU HW will assert the D0i3\_req for that particular function number.

Type	Size	Offset	Default
MMIO	32 bit	405002F4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW/V	<b>D0i3 Bit0 Status (D0I3_BIT0_STATUS_1):</b> D0i3 BIT0 Status register for PCI functions 36 to 32.

#### 14.5.1.118 D0i3 Interrupt Mask 0 (ADR\_D0I3C\_INTR\_STATUS\_CLR\_MSK\_0\_REG) – Offset 405002F8h

Mask register for ADR\_D0I3\_INTR\_0\_REG.

Type	Size	Offset	Default
MMIO	32 bit	405002F8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>D0I3_MASK_0:</b> If sets enable the mask for D0i3 Interrupt for PCI functions 31 to 0.

#### 14.5.1.119 D0i3 Interrupt Mask 1 (ADR\_D0I3C\_INTR\_STATUS\_CLR\_MSK\_1\_REG) — Offset 405002FCh

Mask register for ADR\_D0I3\_INTR\_1\_REG.

Type	Size	Offset	Default
MMIO	32 bit	405002FCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW/V	<b>D0I3 Interrupt Mask 1 (D0I3_MASK_1):</b> If sets enable the mask for D0i3 Interrupt for PCI functions 36 to 32.

#### 14.5.1.120 Power Status (PMU\_PWR\_ST\_REG) — Offset 40500F00h

This register will give indication of whether it is a cold boot/Sx exit, or IP accessible PG exit with ISH in D0i2 or D0i3, with platform in S0 or Sx. ISH ROM FW is expected to read this register, during boot.

Type	Size	Offset	Default
MMIO	32 bit	40500F00h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0000000h RW	<b>FW Status/Track (PWR_ST_FW_ST_TRACK):</b> This field is reserved for ISH FW to place any information which aids in the exit flow.
4	0h RW	<b>IP Accessible PG (PWR_ST_IPAPG):</b> This field indicates if ISH was in an IP accessible PG state prior to this wake. 1: Yes 0: No.
3:2	0h RW	<b>S State (PWR_ST_S_STATE):</b> This field indicates the state in which platform was, prior to this wake. 00: S0/s0ix 01: Sx.
1:0	0h RW	<b>D0ix State (PWR_ST_D0IX_STATE):</b> This field indicates the state in which the ISH was in, prior to this wake. 00: D0i0-Uninitialized 01: D0i1 10: D0i2 11: D0i3.

#### 14.5.1.121 IPAPG Scratch-Pad0 (IPAPG\_SC\_PAD0) – Offset 40500F04h

This register will give additional register bits for FW to store information which could make FW implementation easier and cleaner otherwise. e.g. it could store a NONCE value in AON and this scratchpad before entering IPAPG state and upon exit could compare for match to ensure that there were no exceptions/bugs during the flow.

Type	Size	Offset	Default
MMIO	32 bit	40500F04h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>FW Scratch Pad Register0 (IPAPG_SC_PAD0):</b> Scratch pad for the FW.

#### 14.5.1.122 IPAPG Scratch-Pad1 (IPAPG\_SC\_PAD1) – Offset 40500F08h

This register will give additional register bits for FW to store information which could make FW implementation easier and cleaner otherwise. e.g. it could store a NONCE value in AON and this scratchpad before entering IPAPG state and upon exit could compare for match to ensure that there were no exceptions/bugs during the flow.

Type	Size	Offset	Default
MMIO	32 bit	40500F08h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>FW Scratch Pad Register1 (IPAPG_SC_PAD1):</b> Scratch pad for the FW.

#### 14.5.1.123 IP Accessible PG Enable (IPAPG\_EN\_REG) — Offset 40500F10h

Before executing HALT, ISH FW is expected to set this bit to indicate to PMU if IP accessible PG needs to be enabled while entering D0i2 / D0i3 (along with RF\_ROM\_PG\_EN, 0x30h).

Type	Size	Offset	Default
MMIO	32 bit	40500F10h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW/1C	<b>IPAPG Exit Completed (IPAPG_EXIT_INDICATION):</b> This bit, when set by ISH HW, indicates that ISH HW has completed IPAPG exit sequence. Note that ISH FW/ROM could be out of reset prior to completion of the IPAPG sequence. This bit is to be polled by ISH ROM, if exiting IPAPG state, before boot sequence can be initiated. ISH FW will write 1 to clear this status bit.
7:1	0h RO	<b>Reserved</b>
0	0h RW	<b>IP Accessible PG Enable (IPAPG_EN):</b> This bit, when set indicates that ISH FW should enter into IP accessible PG state, while entering D0ix state (which is controlled by other PMU registers for TCG, RF_ROM PG, etc.).

#### 14.5.1.124 SW PG REQ Interrupt (SW\_PG\_REQ\_INTR) — Offset 40500F14h

This register captures the live status, fall edge,rise edge interrupt status and mask bits for the pmc\_ish\_sw\_pg\_req\_b indication from the PMC.

Type	Size	Offset	Default
MMIO	32 bit	40500F14h	00000018h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	1h RW	<b>Sw_pg_req_b_falledge' INTR Mask Bit. (SW_PG_REQ_FALL_INTR_MASK):</b> This is set by FW when FW doesn't want to generate interrupt to ILB. 0 - enable sw_pg_req_b_falledge interrupt to ILB 1 - disable sw_pg_req_b_falledge interrupt to ILB.
3	1h RW	<b>Sw_pg_req_b_riseedge' INTR Mask Bit (SW_PG_REQ_RISE_INTR_MASK):</b> This is set by FW when FW doesn't want to generate interrupt to ILB. 0 - enable sw_pg_req_b_riseedge interrupt to ILB 1 - disable sw_pg_req_b_riseedge interrupt to ILB.
2	0h RW/1C	<b>Sw_pg_req_b_falledge' INTR Status Bit (SW_PG_REQ_FALL_INTR_STATUS):</b> This is bit is set by HW whenever a fall edge is detected in the 'pmc_ish_sw_pg_req_b' signal. This bit will also be tied to the IOAPIC RTE entry in iLB as interrupt source to Minute IA. FW needs to clear this bit after every fall edge to receive an interrupt on the next fall edge. Note to ISH FW: This bit indicates that PMC is allowing entry into IPAPG state. Note that this bit will be set irrespective of which D0ix state ISH is in. ISH FW needs to keep this interrupt masked by setting bit[4] of this register to 1, if this event notification is not needed.
1	0h RW/1C	<b>Sw_pg_req_b_riseedge' INTR Status Bit (SW_PG_REQ_RISE_INTR_STATUS):</b> This is bit is set by HW whenever a rise edge is detected in the 'pmc_ish_sw_pg_req_b' signal. This bit will also be tied to the IOAPIC RTE entry in iLB as interrupt source to Minute IA. FW needs to clear this bit after every rise edge to receive an interrupt on the next rise edge. Note to ISH FW: This bit indicates that PMC wants ISH to get out of IPAPG state. Note that this bit will be set irrespective of whether ISH is in IPAPG state or not. ISH FW needs to keep this interrupt masked by setting bit[3] of this register to 1.
0	0h RO	<b>Pmc_ish_sw_pg_req_b Live Status (SW_PG_REQ_B_ASSERTED):</b> Reflects the live value of pmc_ish_sw_pg_req_b. 1- pmc_ish_sw_pg_req_b is deasserted. 0- pmc_ish_sw_pg_req_b is asserted.

#### 14.5.1.125 ISH PMC WAKE INTR (PMC\_WAKE\_INT\_REG) — Offset 40500F18h

This register captures the live status, fall edge,rise edge interrupt status and mask bits for the pmc\_ish\_pg\_wake indication from the PMC.

Type	Size	Offset	Default
MMIO	32 bit	40500F18h	00000018h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	1h RW	<b>Pmc_wake_falledge' INTR Mask Bit (PMU_PMC_WAKE_FALL_INT_MASK):</b> This is set by FW when FW doesn't want to generate interrupt to ILB. 0 - enable pmc_wake_falledge interrupt to ILB 1 - disable pmc_wake_falledge interrupt to ILB.
3	1h RW	<b>Pmc_wake_riseedge' INTR Mask Bit (PMU_PMC_WAKE_RISE_INT_MASK):</b> This is set by FW when FW doesn't want to generate interrupt to ILB. 0 - enable pmc_wake_riseedge interrupt to ILB 1 - disable pmc_wake_riseedge interrupt to ILB.
2	0h RW/1C	<b>Pmc_wake_falledge' INTR Status Bit (PMU_PMC_WAKE_FALL_INT):</b> This is bit is set by HW whenever a fall edge is detected in the 'pmc_ish_pg_wake' signal. This bit will also be tied to the IOAPIC RTE entry in iLB as interrupt source to Minute IA. FW needs to clear this bit after every fall edge to receive an interrupt on the next fall edge. Note to ISH FW: This bit indicates that PMC is allowing ISH to get into IPAPG state. Note that this bit will be set irrespective of whether ISH is in IPAPG state or not. ISH FW needs to keep this interrupt masked by setting bit[4] of this register to 1.
1	0h RW/1C	<b>Pmc_wake_riseedge' INTR Status Bit (PMU_PMC_WAKE_RISE_INT):</b> This is bit is set by HW whenever a rise edge is detected in the 'pmc_ish_pg_wake' signal. This bit will also be tied to the IOAPIC RTE entry in iLB as interrupt source to Minute IA. FW needs to clear this bit after every rise edge to receive an interrupt on the next rise edge. Note to ISH FW: This bit indicates that PMC wants ISH to get out of IPAPG state. Note that this bit will be set irrespective of whether ISH is in IPAPG state or not. ISH FW needs to keep this interrupt masked by setting bit[3] of this register to 1.
0	0h RO	<b>Pmc_ish_pg_wake' Live Status Register (PMU_PMC_WAKE_LIVE):</b> Reflects the live value of pmc_ish_pg_wake. 1- pmc_ish_pg_wake is asserted. 0- pmc_ish_pg_wake is de-asserted.

#### 14.5.1.126 ISH BRIDGEISOL CTL(Supported Only When There Is Sx Usage) (PMU\_BRISOLCTL\_REG) — Offset 40500F24h

This register captures the live status, fall edge,rise edge interrupt status and mask bits for the rst\_isol\_ack signal from IOSF2OCP bridge along with the bit to drive the br\_isol\_req to the IOSF2OCP bridge.

Type	Size	Offset	Default
MMIO	32 bit	40500F24h	00000030h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0000000h RO	<b>RSV:</b> Reserved
5	1h RW	<b>Br_RST_ISOL_ACK_FALL' INTR Mask Bit (PMU_BR_ISOL_ACK_FALL_MASK):</b> This is set by FW when FW doesn't want to generate interrupt to ILB. 0 - enable br_RST_ISOL_ACK_FALL interrupt to ILB 1 - disable br_RST_ISOL_ACK_FALL interrupt to ILB.
4	1h RW	<b>Br_RST_ISOL_ACK_RISE' INTR Mask Bit (PMU_BR_ISOL_ACK_RISE_MASK):</b> This is set by FW when FW doesn't want to generate interrupt to ILB. 0 - enable br_RST_ISOL_ACK_RISE interrupt to ILB 1 - disable br_RST_ISOL_ACK_RISE interrupt to ILB.
3	0h RW/1C	<b>Br_RST_ISOL_ACK_FALL' INTR Status Bit (PMU_BR_ISOL_ACK_FALL):</b> This bit is set by HW whenever a fall edge is detected in the 'br_RST_ISOL_ACK' signal. This bit will also be tied to the IOAPIC RTE entry in iLB as interrupt source to Minute IA. FW needs to clear this bit after every fall edge to receive an interrupt on the next fall edge. Note to ISH FW: This bit indicates that the br_RST_ISOL_ACK has been de-asserted.
2	0h RW/1C	<b>Br_RST_ISOL_ACK_RISE' INTR Status Bit (PMU_BR_ISOL_ACK_RISE):</b> This bit is set by HW whenever a rise edge is detected in the 'br_RST_ISOL_ACK' signal. This bit will also be tied to the IOAPIC RTE entry in iLB as interrupt source to Minute IA. FW needs to clear this bit after every rise edge to receive an interrupt on the next rise edge. Note to ISH FW: This bit indicates that the br_RST_ISOL_ACK has been asserted and the reset isolation in the bridge is completed.
1	0h RO	<b>Bridge Host Reset Isolation Acknowledge (BR_ISOL_ACK) (PMU_BR_ISOL_ACK):</b> This bit provides ISH FW visibility onto the state of the internal signal from the IOSF2OCP bridge which acts as an acknowledge to the signal from the BR_ISOL_REQ bit below. Behavior: 1: signal is active - Bridge is acknowledging having entered Host reset isolation mode 0 (default): signal is inactive.
0	0h RW/1S	<b>Bridge Host Reset Isolation Request (BR_ISOL_REQ) (PMU_BR_ISOL_REQ):</b> This bit drives an internal ISH signal to the IOSF2OCP Bridge which acts as a request for the Bridge to enter its Host partition reset regime, thereby isolating it in preparation of host_prim_RST_B assertion. Note that ISH HW will auto-clear this bit upon the assertion of host_RST_B signal. ISH HW also ensures that this bit is cleared at least 3 clocks AFTER the assertion event of host_RST_B. Behavior: 1: signal is active - Bridge is requested to enter Host reset isolation mode 0 (default): signal is inactive no change in Bridge state requested.

#### 14.5.1.127 CDC Config Clock Gate Disable(Required Only During Sx Usage) (PMU\_CDCCGDIS\_REG) — Offset 40500F28h

The clock gate disable register is required for Sx support in CNL SOC. The FW is expected to program bit 0 of this register before bootprep ack is sent until the hostprim reset is de-asserted.

Type	Size	Offset	Default
MMIO	32 bit	40500F28h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	<b>Reserved</b>
17:0	00000h RW	<b>ISH CDC Config Clkgate Disable Register (CDCCGDIS):</b> The clock gate disable register is required for Sx support in CNL SOC. The FW is expected to program bit 0 of this register before bootprep ack is sent until the hostprim reset is de-asserted.

#### 14.5.1.128 PCE ISH FW Local (PMU\_PCE\_LOCAL\_REG) – Offset 40500F30h

This register is the local version of PCI.PCE register. It is the responsibility of ISH FW to keep this register contents coherent to PCI. PCE register (as indicated by PCE SHADOW register). ISH HW will use the contents of this register for all IPAPG decisions.

Type	Size	Offset	Default
MMIO	32 bit	40500F30h	00000200h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	<b>Reserved</b>
9	1h RW	<b>PCE Change Detect Interrupt Mask (PMU_PCE_CHG_DETECT_INTR_MASK):</b> This is set by FW when FW doesn't want to generate interrupt to ILB. 0 - enable PCE Change Detected interrupt to ILB 1 - disable PCE Change Detected interrupt to ILB.
8	0h RW/1C	<b>PCE Change Detect Interrupt Status (PMU_PCE_CHG_DETECT_INTR):</b> This is bit is set by HW whenever any change in value of PCE SHADOW REGISTER is detected. This bit will also be tied to the IOAPIC RTE entry in iLB as interrupt source to Minute IA. FW needs to clear this bit after every receiving an interrupt.
7:5	0h RO	<b>Reserved</b>
4	0h RW	<b>Hardware Autonomous Enable (HAE) (PMU_PCE_HAE_LOCAL):</b> If set, then the PGCB may request a PG whenever it is idle. NOTE: If this bit is set, then bits [2:0] must be 000 .

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	<b>Sleep Enable (SE) (PMU_PCE_SLEN_LOCAL):</b> If clear, then IP will never assert Sleep to the retention flops. If set, then IP may assert Sleep during PG'ing.
2	0h RW	<b>D3Hot Enable (D3HEN) (PMU_PCE_D3HEN_LOCAL):</b> If 1 , then function will request power gating when idle and the PMCSR[1:0] register in the function = 11 (D3).
1	0h RW	<b>IDLE Enable (IDLEN) (PMU_PCE_IDLEEN_LOCAL):</b> If 1 , then the function will request power gating when idle and the DEVIDLEC register (DEVIDLEC[DEVIDLE] = 1 ) is set. This bit should be RO if DEVIDLEC capability is not implemented. .
0	0h RW	<b>PMC Request Enable (PMCRE) (PMU_PCE_PMCRE_LOCAL):</b> If this bit is set to 1 , the function will request power gating when idle and pmc_ip_sw_pg_req_b = 0 . NOTE: PMCSR[1:0] may be any value and the function must power gate if this bit is set and pmc_ip_sw_pg_req_b is asserted and the device is idle. Default value may be SOC and/or IP specific. .

#### 14.5.1.129 ISH SRAM Bitline Float Enable (ADR\_SRAM\_SLEEPB) — Offset 40500F34h

SRAM\_SLEEPB.

Type	Size	Offset	Default
MMIO	32 bit	40500F34h	00000000h

406000D0h	4	Trunk Clock Gate Rise Interrupt Status (TCG_CLKACK_RISE_INTR_STS)	00000000h
406000D4h	4	Trunk Clock Gate Fall Interrupt Status (TCG_CLKACK_FALL_INTR_STS)	00000000h
406000D8h	4	CORE_CLK_SEL Reg (CORE_CLK_SEL)	00000000h
406000DCh	4	AON Clock Gate Enable (AON(CG_EN)	00000100h

#### 14.6.1.1 Trunk Clock Gate (TRUNK(CG) — Offset 40600000h

Register for enabling trunk clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600000h	0000FFFEh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	1h RW	<b>TCG_GBE2_RGMII_PHY_RX:</b> 1 initiates trunk clock gating, 0 no clock gating for GBE2_RGMII_PHY_RX clock.
14	1h RW	<b>TCG_GBE1_RGMII_PHY_RX:</b> 1 initiates trunk clock gating, 0 no clock gating for GBE1_RGMII_PHY_RX clock.
13	1h RW	<b>TCG_GBE2_SGMII_PHY_RX:</b> 1 - initiates trunk clock gating, 0 no clock gating for GBE2_SGMII_PHY_RX clock.
12	1h RW	<b>TCG_GBE1_SGMII_PHY_RX:</b> 1 - initiates trunk clock gating, 0 no clock gating for GBE1_SGMII_PHY_RX clock.
11	1h RW	<b>TCG_GBE2_SGMII_REF:</b> 1 - initiates trunk clock gating, 0 no clock gating for GBE2_SGMII_REF clock.
10	1h RW	<b>TCG_GBE1_SGMII_REF:</b> 1 - initiates trunk clock gating, 0 no clock gating for GBE1_SGMII_REF clock.

Bit Range	Default & Access	Field Name (ID): Description
9	1h RW	<b>TCG_GBE2_RGMII_TX:</b> 1 - initiates trunk clock gating, 0 no clock gating for GBE2_RGMII_TX clock.
8	1h RW	<b>TCG_GBE1_RGMII_TX:</b> 1 - initiates trunk clock gating, 0 no clock gating for GBE1_RGMII_TX clock.
7	1h RW	<b>TCG_GBE_PTP:</b> 1 - initiates trunk clock gating, 0 no clock gating for GBE_PTP clock.
6	1h RW	<b>TCG_PLL_PTP:</b> 1 - initiates trunk clock gating, 0 no clock gating for PLL_PTP clock.
5	1h RW	<b>TCG_ADC_CTRL:</b> 1 - initiates trunk clock gating, 0 no clock gating for ADC_CTRL clock.
4	1h RW	<b>TCG_ADC_HIP:</b> 1 initiates trunk clock gating, 0 no clock gating for ADC_HIP clock.
3	1h RW	<b>TCG_LCPLL_REF:</b> 1 initiates trunk clock gating, 0 no clock gating for LCPLL_REF clock.
2	1h RW	<b>TCG_MAIN:</b> 1 initiates trunk clock gating, 0 no clock gating for MAIN clock.
1	1h RW	<b>TCG_CPU_FAST:</b> 1 initiates trunk clock gating, 0 no clock gating for CPU_FAST clock.
0	0h RW	<b>TCG_SOIX_XTAL:</b> 1 initiates trunk clock gating, 0 no clock gating for SOIX_XTAL clock.

#### 14.6.1.2 Block Level Clock Gate (BLK(CG) — Offset 40600004h

Register for enabling block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>HPET Clock Gate Register (CCU_HPET(CG):</b> ILB-HPET clock gating register. 1-Clock gate ILB-HPET 0-No ILB-HPET clock gating.
0	0h RO	<b>Reserved</b>

#### 14.6.1.3 Block Level Clock Gate- UART (UART\_BLK(CG) — Offset 40600008h

Register for enabling UART block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>Block Levell Gate Enable - UART (CCUREG_UART(CG)):</b> UART Clock gating register. 1-Clock gate 0-No clock gating.

#### 14.6.1.4 Block Level Clock Gate- I2C (I2C\_BLK\_CG) – Offset 4060000Ch

Register for enabling I2C block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	4060000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>Block Levell Gate Enable - I2C (CCUREG_I2C(CG)):</b> I2C Clock gating register. 1-Clock gate 0-No clock gating.

#### 14.6.1.5 Block Level Clock Gate- SPI (SPI\_BLK\_CG) – Offset 40600010h

Register for enabling SPI block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>Block Levell Gate Enable - SPI (CCUREG_SPI(CG)):</b> SPI Clock gating register. 1-Clock gate 0-No clock gating.

#### 14.6.1.6 Block Level Clock Gate- GPIO (GPIO\_BLK(CG)) — Offset 40600014h

Register for enabling GPIO block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Block Levell Gate Enable - GPIO (CCUREG_GPIO(CG)):</b> GPIO clock gating register. 1-Clock gate GPIO 0-No GPIO clock gating.

#### 14.6.1.7 Block Level Clock Gate- I2S (I2S\_BLK(CG)) — Offset 40600018h

Register for enabling I2S block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Block Levell Gate Enable - I2S (CCUREG_I2S(CG)):</b> Reserved

#### 14.6.1.8 Block Level Clock Gate- SRAM (SRAM\_BLK(CG)) – Offset 40600020h

Register for enabling SRAM block level clock gating for L2 Bank.

Type	Size	Offset	Default
MMIO	32 bit	40600020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>Block Levell Gate Enable - SRAM (CCUREG_SRAM(CG)):</b> SRAM Clock gating register. 1-Clock gate 0-No clock gating.

#### 14.6.1.9 Block Level Clock Gate- QEP (QEP\_BLK(CG)) – Offset 40600024h

Register for enabling QEP block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>Block Level Gate Enable - QEP (CCUREG_QEP(CG)):</b> QEP Clock gating register. 1-Clock gate 0-No clock gating.

#### 14.6.1.10 Block Level Clock Gate- DMA (DMA\_BLK(CG)) — Offset 40600028h

Register for enabling DMA block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600028h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>Block Level Clock Gating Register - DMA (CCUREG_DMA(CG)):</b> DMA clock gating register. 1-Clock gate DMA 0-No DMA clock gating.

#### 14.6.1.11 Block Level Clock Gate- PWM (PWM\_BLK(CG)) — Offset 4060002Ch

Register for enabling PWM block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	4060002Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Block Levell Gate Enable - PWM (CCUREG_PWM(CG)):</b> PWM Clock gating register. 1-Clock gate 0-No clock gating.

#### 14.6.1.12 Block Level Clock Gate- ADC (ADC\_BLK(CG)) – Offset 40600030h

Register for enabling ADC block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>Block Levell Gate Enable - ADC (CCUREG_ADC(CG)):</b> Reserved

#### 14.6.1.13 Block Level Clock Gate- CANBUS (CANBUS\_BLK(CG)) – Offset 40600034h

Register for enabling CANBUS block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Block Level Gate Enable - CANBUS (CCUREG_CANBUS_CG):</b> CANBUS Clock gating register. 1-Clock gate 0-No clock gating.

#### 14.6.1.14 Reset History (RST\_HIS) – Offset 4060003Ch

Reset history register.

Type	Size	Offset	Default
MMIO	32 bit	4060003Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW/1C	<b>Reset History For SRECC (CCUREG_SRAMECC_RST_HIST):</b> Used to indicate SRECC reset 1-indicates SRECC reset 0-No SRECC reset.
2	0h RW/1C	<b>Reset History For MIASS (CCUREG_MIASS_RST_HIST):</b> Used to indicate MIASS reset 1-indicates MIASS reset 0-No MIASS reset.
1	0h RW/1C	<b>Reset History For WD (CCUREG_WD_RESET_HIST):</b> Used to indicate WD reset 1-indicates WD reset 0-No WD reset.
0	0h RW/1C	<b>Reset History For SW (CCUREG_SW_RESET_HIST):</b> Used to indicate SW reset 1-indicates SW reset 0-No SW reset.

#### 14.6.1.15 Trunk Gate Disable (TRUNK(CG)\_DIS) – Offset 40600040h

Register for disabling the trunk clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600040h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	1h RW	<b>Trunk Clock Gate Disable (CCUREG_TRUNK(CG)_DIS):</b> Used to disable ISH trunk level clock gating. Note- (Ref. Sighting 4796578) When this bit is set, this will disable only the toggling of clk_req/clk_ack signals. Clock gating of internal blocks are disabled only by the Block Gate Disable register (0x3C). 1-disable ISH trunk level clock gating (keep clk_req always on) 0-enable trunk level clock gating.

#### 14.6.1.16 Block Gate Disable (BLK(CG)\_DIS) – Offset 40600044h

Register for disabling the block gate gating.

Type	Size	Offset	Default
MMIO	32 bit	40600044h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW	<b>Checker Bit Choosing Async Path (ASYNC_PATH):</b> Choosing async path during 400/200 clk mode.
7:2	0h RO	<b>Reserved</b>
1	0h RW	<b>Wdt Clk Gating Disable (WDT(CG)_DIS):</b> Setting this bit to 1 - disables wdt clk gating when CORE is halted, 0 enables wdt clk gating.
0	1h RW	<b>Block Level Clock Gate Disable (CCU_REG_INT(CG)_DIS):</b> Used to disable ISH internal clock gating 1-Disable ISH clock block clock gating0-Enable ISH block clock gating.

#### 14.6.1.17 Soft Reset (SOFT\_RST) – Offset 40600048h

Register for enabling the soft reset.

Type	Size	Offset	Default
MMIO	32 bit	40600048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2	0h RW	<b>Soft Reset Enable - ILB (CCUREG_ILB_RST):</b> ILB soft reset bit. 1-Reset asserted 0-Reset de-asserted.
1	0h RW	<b>Soft Reset Enable - OCP Bridge (CCUREG_OCP_BRIDGE_RST):</b> OCP_BRIDGE soft reset bit. 1-Reset asserted 0-Reset de-asserted.
0	0h RW	<b>Soft Reset Enable - WD (CCUREG_WD_RST):</b> WD soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.18 Soft Reset- UART (UART\_SOFT\_RST) – Offset 4060004Ch

Register for Soft Reset of UART.

Type	Size	Offset	Default
MMIO	32 bit	4060004Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>Soft Reset Enable - UART (CCUREG_UART_RST):</b> Soft reset bit for UART. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.19 Soft Reset- I2C (I2C\_SOFT\_RST) – Offset 40600050h

Register for Soft Reset of I2C.

Type	Size	Offset	Default
MMIO	32 bit	40600050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>Soft Reset Enable - I2C (CCUREG_I2C_RST_INT):</b> I2C soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.20 Soft Reset- SPI (SPI\_SOFT\_RST) — Offset 40600054h

Register for Soft Reset of SPI.

Type	Size	Offset	Default
MMIO	32 bit	40600054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>Soft Reset Enable - SPI (CCUREG_SPI_RST):</b> SPI soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.21 Soft Reset- GPIO (GPIO\_SOFT\_RST) — Offset 40600058h

Register for Soft Reset of GPIO.

Type	Size	Offset	Default
MMIO	32 bit	40600058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Soft Reset Enable - GPIO (CCUREG_GPIO_RST):</b> GPIO soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.22 Soft Reset- I2S (I2S\_SOFT\_RST) – Offset 4060005Ch

Register for Soft Reset of I2S.

Type	Size	Offset	Default
MMIO	32 bit	4060005Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Soft Reset Enable - I2S (CCUREG_I2S_RST):</b> Reserved

#### 14.6.1.23 Soft Reset- SRAM (SRAM\_SOFT\_RST) – Offset 40600064h

Register for Soft Reset of SRAM.

Type	Size	Offset	Default
MMIO	32 bit	40600064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>Soft Reset Enable - SRAM (CCUREG_SRAM_RST):</b> Sram soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.24 Soft Reset- QEP (QEP\_SOFT\_RST) — Offset 40600068h

Register for Soft Reset of QEP.

Type	Size	Offset	Default
MMIO	32 bit	40600068h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>Soft Reset Enable - QEP (CCUREG_QEP_RST):</b> QEP soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.25 Soft Reset- PWM (PWM\_SOFT\_RST) — Offset 4060006Ch

Register for Soft Reset of PWM.

Type	Size	Offset	Default
MMIO	32 bit	4060006Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Soft Reset Enable - PWM (CCUREG_PWM_RST):</b> PWM soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.26 Soft Reset- ADC (ADC\_SOFT\_RST) – Offset 40600070h

Register for Soft Reset of ADC.

Type	Size	Offset	Default
MMIO	32 bit	40600070h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>Soft Reset Enable - ADC (CCUREG_ADC_RST):</b> Reserved

#### 14.6.1.27 Soft Reset- CANBUS (CANBUS\_SOFT\_RST) – Offset 40600074h

Register for Soft Reset of CANBUS.

Type	Size	Offset	Default
MMIO	32 bit	40600074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Soft Reset Enable - CANBUS (CCUREG_CANBUS_RST):</b> CANBUS soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.28 Clock Divider WD (CKDIV\_WD) — Offset 4060007Ch

Register for enabling the clock divider - WD.

Type	Size	Offset	Default
MMIO	32 bit	4060007Ch	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000001h RW	<b>Div Ratio For WDT Clock (CCUREG_CLKDIV_WD):</b> Divide ratio to generate WDT clock from PERI clock.

#### 14.6.1.29 Clock Divider LDO (CKDIV\_LDO) — Offset 40600080h

Register for enabling the clock divider - LDO.

Type	Size	Offset	Default
MMIO	32 bit	40600080h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2:0	5h RW	<b>Div Ratio For LDO (CCUREG_CLKDIV_LDO):</b> Divide ratio for LDO.

#### 14.6.1.30 Global Reset (GLBL\_RST\_EN) — Offset 40600084h

Register for enabling the global reset.

Type	Size	Offset	Default
MMIO	32 bit	40600084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>Global Reset Enable (CCUREG_GLBL_RST_EN):</b> Unused in GLV. Global reset enable register These bits enable (when set) and disable (when cleared) the indication to PMC for initiating global reset on the following conditions: Bit[0] Enable for IPC/SW reset assertion. Bit[1] Enable for MIA subsystem shutdown. Bit[2] Enable for fabric interrupt. Bit[3] Enable for fabric UR. .

#### 14.6.1.31 Trunk Clock Gate Status (TCG\_STS\_REG) — Offset 40600088h

TCG Status bits for various clocks. If set to 1, clk is gated. The status is cleared when clkack for respective clks are high. Each bit is for the clks related to the respective bit in TCG register.

Type	Size	Offset	Default
MMIO	32 bit	40600088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	0h RO/V	<b>TCG_STS_GBE2_RGMII_PHY_RX:</b> TCG_STS_GBE2_RGMII_PHY_RX field.
14	0h RO/V	<b>TCG_STS_GBE1_RGMII_PHY_RX:</b> TCG_STS_GBE1_RGMII_PHY_RX field.
13	0h RO/V	<b>TCG_STS_GBE2_SGMII_PHY_RX:</b> TCG_STS_GBE2_SGMII_PHY_RX field.
12	0h RO/V	<b>TCG_STS_GBE1_SGMII_PHY_RX:</b> TCG_STS_GBE1_SGMII_PHY_RX field.
11	0h RO/V	<b>TCG_STS_GBE2_SGMII_REF:</b> TCG_STS_GBE2_SGMII_REF field.
10	0h RO/V	<b>TCG_STS_GBE1_SGMII_REF:</b> TCG_STS_GBE1_SGMII_REF field.
9	0h RO/V	<b>TCG_STS_GBE2_RGMII_TX:</b> TCG_STS_GBE2_RGMII_TX field.
8	0h RO/V	<b>TCG_STS_GBE1_RGMII_TX:</b> TCG_STS_GBE1_RGMII_TX field.
7	0h RO/V	<b>TCG_STS_GBE_PTP:</b> TCG_STS_GBE_PTP field.
6	0h RO/V	<b>TCG_STS_PLL_PTP:</b> TCG_STS_PLL_PTP field.
5	0h RO/V	<b>TCG_STS_ADC_CTRL:</b> TCG_STS_ADC_CTRL field.
4	0h RO/V	<b>TCG_STS_ADC_HIP:</b> TCG_STS_ADC_HIP field.
3	0h RO/V	<b>TCG_STS_LCPLL_REF:</b> TCG_STS_LCPLL_REF field.
2	0h RO/V	<b>TCG_STS_MAIN:</b> TCG_STS_MAIN field.
1	0h RO/V	<b>TCG_STS_CPU_FAST:</b> TCG_STS_CPU_FAST field.
0	0h RO/V	<b>TCG_STS_SOIX_XTAL:</b> TCG_STS_SOIX_XTAL field.

#### 14.6.1.32 Soft Reset- DMA (DMA\_SOFT\_RST) – Offset 4060008Ch

Register for Soft Reset of DMA.

Type	Size	Offset	Default
MMIO	32 bit	4060008Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>Soft Reset Enable - DMA (CCUREG_DMA_RST):</b> DMA soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.33 Block Level Clock Gate- GBE (GBE\_BLK(CG) — Offset 40600090h

Register for enabling GBE block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	40600090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Block Level Gate Enable GBE (CCUREG_GBE(CG):</b> CANBUS Clock gating register. 1-Clock gate 0-No clock gating.

#### 14.6.1.34 Soft Reset GBE (GBE\_SOFT\_RST) — Offset 40600094h

Register for Soft Reset of GBE.

Type	Size	Offset	Default
MMIO	32 bit	40600094h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Soft Reset Enable GBE (CCUREG_GBE_RST):</b> CANBUS soft reset bit. 1-Reset asserted 0-Reset de-asserted.

#### 14.6.1.35 Trunk Clock Gate Rise Interrupt Mask (TCG\_CLKACK\_RISE\_INTR\_MASK) — Offset 40600098h

RISE Interrupt mask bits for each TCG clk. When bit is set, the interrupt due to the respective clk is disabled.

Type	Size	Offset	Default
MMIO	32 bit	40600098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	0h RW	<b>TCG_RISE_INTR_MASK_GBE2_RGMII_PHY_RX:</b> TCG_RISE_INTR_MASK_GBE2_RGMII_PHY_RX field.

#### 14.6.1.37 HBW\_CLK\_SEL Reg (HBW\_CLK\_SEL) – Offset 406000A8h

Clock hbw switch control bits. Clock switching is done after HBW is halted. Switch enable is auto cleared by hardware after switching is complete. PMU intr is generated when switching is complete.

Type	Size	Offset	Default
MMIO	32 bit	406000A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW	<b>Clkswitch En (CLK_SW_EN):</b> FW write 1 and HW auto clear.
7:1	0h RO	<b>Reserved</b>
0	0h RW	<b>Clk Sel Value (CLK_SELECT):</b> Bit[0] - Selection control for HBW clk. 0 - S0ix_clk - 100MHz 1 - Main_clk_div2 - 200MHz bit[8] - HBW clk switch Enable Clock switching is done after CORE is halted. Switch enable is auto-cleared by hardware after switching is complete. PMU intr is generated when switching is complete. .

#### 14.6.1.38 M Value M/N Divide- I2S0 (I2S0\_MNDIV\_M\_VALUE) — Offset 406000B0h

M/N Divide Register for M Value - I2S0.

Type	Size	Offset	Default
MMIO	32 bit	406000B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	<b>Reserved</b>

#### 14.6.1.39 N Value M/N Divide- I2S0 (I2S0\_MNDIV\_N\_VALUE) — Offset 406000B4h

M/N Divide Register for N Value - I2S0.

**Note:** Bit definitions are the same as I2S0\_MNDIV\_M\_VALUE, offset 406000B0h.

**14.6.1.40 Enable - M/N Divide- I2S0 (I2S0\_MNDIV\_ENABLE) — Offset 406000B8h**

M/N Divide Enable Register - I2S0.

**Note:** Bit definitions are the same as I2S0\_MNDIV\_M\_VALUE, offset 406000B0h.

**14.6.1.41 M Value M/N Divide- I2S1 (I2S1\_MNDIV\_M\_VALUE) — Offset 406000BCh**

M/N Divide Register for M Value - I2S1.

**Note:** Bit definitions are the same as I2S0\_MNDIV\_M\_VALUE, offset 406000B0h.

**14.6.1.42 N Value M/N Divide- I2S1 (I2S1\_MNDIV\_N\_VALUE) — Offset 406000C0h**

M/N Divide Register for N Value - I2S1.

**Note:** Bit definitions are the same as I2S0\_MNDIV\_M\_VALUE, offset 406000B0h.

**14.6.1.43 Enable - M/N Divide- I2S1 (I2S1\_MNDIV\_ENABLE) — Offset 406000C4h**

M/N Divide Enable Register - I2S1.

**Note:** Bit definitions are the same as I2S0\_MNDIV\_M\_VALUE, offset 406000B0h.

**14.6.1.44 Soft Reset GPIO (TGPI0\_SOFT\_RST) — Offset 406000C8h**

Register for Soft Reset of GPIO.

Type	Size	Offset	Default
MMIO	32 bit	406000C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved
1:0	0h RW	Soft Reset Enable GPIO (CCUREG_TGPIO_RST): Reserved

**14.6.1.45 Block Level Clock Gate GPIO (TGPI0\_BLK\_OCPG) — Offset 406000CCh**

Register for enabling GPIO block level clock gating.

Type	Size	Offset	Default
MMIO	32 bit	406000CCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>Block Level Gate Enable TGPIO OCPCLK (CCUREG_TGPIO_OCPG):</b> Reserved

#### 14.6.1.46 Trunk Clock Gate Rise Interrupt Status (TCG\_CLKACK\_RISE\_INTR\_STS) — Offset 406000D0h

RISE Interrupt status bits for each TCG clk. The sts bit is set on rise-edge of clkack. Each bit is for the clks related to the respective bit in TCG register. .

Type	Size	Offset	Default
MMIO	32 bit	406000D0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	0h RW/1C	<b>TCG_RISE_INTR_STS_GBE2_RGMII_PHY_RX:</b> TCG_RISE_INTR_STS_GBE2_RGMII_PHY_RX field.

#### 14.7.1.1 DFX VISA Milestone (DFX\_VISA\_MILESTONE) — Offset 40700090h

DFX VISA Milestone.

Type	Size	Offset	Default
MMIO	32 bit	40700090h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>DFX_VISA_MILESTONE_BIT31TO0:</b> Software code execution milestone indication This will be used in VISA observe ability for getting performance metrics of code execution Usage will be to have this observed on a Logic Analyzer.

#### 14.7.1.2 ISH RTC Counter LSB Value (ISH\_RTC\_COUNTER0) — Offset 40700094h

ISH RTC counter LSB value Register.

Type	Size	Offset	Default
MMIO	32 bit	40700094h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>ISH_RTC_COUNTER0:</b> ISH_RTC_COUNTER0 : ISH RTC counter LSB value Register.

#### 14.7.1.3 ISH RTC Counter MSB Value (ISH\_RTC\_COUNTER1) — Offset 40700098h

ISH RTC counter MSB value Register.

Type	Size	Offset	Default
MMIO	32 bit	40700098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>ISH_RTC_COUNTER1:</b> ISH_RTC_COUNTER1 : ISH RTC counter MSB value Register.

#### 14.7.1.4 ISH\_MISC\_UART\_CKN — Offset 407000ACh

Reserved

Type	Size	Offset	Default
MMIO	32 bit	407000ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	Reserved

#### 14.7.1.5 ISH\_MISC\_VMID — Offset 407000B0h

Reserved

**Note:** Bit definitions are the same as ISH\_MISC\_UART\_CKN, offset 407000ACh.

#### 14.7.1.6 ISH\_LMTHH\_DEFEATURE — Offset 407000B4h

Reserved

**Note:** Bit definitions are the same as ISH\_MISC\_UART\_CKN, offset 407000ACh.

#### 14.7.1.7 NMI Enable (ISH\_NMI\_EN) — Offset 407000B8h

Reserved

**Note:** Bit definitions are the same as ISH\_MISC\_UART\_CKN, offset 407000ACh.

#### 14.7.1.8 HH ART Timestamp Control (HH\_ART\_TS\_CTRL) — Offset 407000C0h

HH ART Timestamp Control Register.

Type	Size	Offset	Default
MMIO	32 bit	407000C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:4	0h RW	<b>HH_ART_TIMER_SEL:</b> TIMER_SEL[1:0] selects the timer from which FW wants to read the timestamp 00 - XTAL_CLK timer 01 - AON_CLK timer 10 - RTC_CLK timer .
3:2	0h RO	<b>Reserved</b>
1	0h RW/AC	<b>HH_FWUPD:</b> The FWUpd Bit will be asserted Fw when the RTSS SB EPHW will receive LocalSync packet and interrupt RTSS FW to write the received ART timer value when asserted indicated that the new FW_VALUE . HH block will update the Free running Local ART with the new calculated FW_VALUE on FwUpd Re pulse and will set the FWUpd_done pulse for clearing this Bit. FW set and auto clear on Hardware intervention(pulse) .
0	0h RW	<b>HH_TIMESTAMP_EN:</b> 1: HH_time_stamp_en would be provided and asserted for all valid the syncCntr pulse are generated 0: HH_time_stamp_en deasserted incated that no valid the synccntr pulse for HH block and can be ignored .

#### 14.7.1.9 [31:0] Of HH FW Value Low (HH\_ART\_TB\_STAMP\_LOW) – Offset 407000C4h

[31:0] of HH FW Value Low.

Type	Size	Offset	Default
MMIO	32 bit	407000C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>HH_FW_VALUE_LOW:</b> RTSS SB EPHW will receive LocalSync packet and interrupt RTSS FW to write the NEW received ART timer value in FW_VALUE. Free running Local ART will be updated with this FW_VALUE on FwUpd .

#### 14.7.1.10 [63:32] Of HH FW Value High (HH\_ART\_TB\_STAMP\_HIGH) — Offset 407000C8h

[63:32] of HH FW Value High.

Type	Size	Offset	Default
MMIO	32 bit	407000C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>HH_FW_VALUE_HIGH:</b> RTSS SB EPHW will receive LocalSync packet and interrupt RTSS FW to write the NEW received ART timer value in FW_VALUE. Free running Local ART will be updated with this FW_VALUE on FwUpd .

#### 14.7.1.11 HH Saturation Staus (HH\_SATURATION) — Offset 407000CCh

HH Saturation Staus Register.

Type	Size	Offset	Default
MMIO	32 bit	407000CCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RO	<b>HH_UPD_IN_PROG:</b> 1: xtal_clk timer update is in progress 0: xtal_clk timer is ready to be read by FW. FW needs to make sure that xtal_clkack status is high before reading this bit.
0	0h RW/1C	<b>HH_SAT_STAT:</b> 1: stauration has occurred . 0: No stauration occurred FW needs to ensure that there is no Saturation Event status set for the Delay Counter. The 17bit counter will saturate at max programmable value will set a status bit SAT_STAT in Saturation register on MSB bit being 1 to indicate saturation event has occurred . If SAT_STAT is set,asserted by delaycounter logic in Hh Block , the RTSS . FW is expected to restart the LOCAL ART SYNC Update flow and clear this bit on read .

#### 14.7.1.12 [31:0[]] Of Local Art Sync Counter (HH\_ART\_RD\_TS\_SNAPSHOT\_LOW) — Offset 407000D0h

[31:0[]] of Local Art Sync Counter.

Type	Size	Offset	Default
MMIO	32 bit	407000D0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>ISH_HH_ART_RD_TS_SNAPSHOT:</b> FW Will Read this Locally Updated HH Time stamp Value to verify whether the correct HH Time stamp is written into the IP.

#### 14.7.1.13 [63:32] OfLocal Art Sync Counter (HH\_ART\_RD\_TS\_SNAPSHOT\_HIGH) – Offset 407000D4h

[63:32] of Local Art Sync Counter.

**Note:** Bit definitions are the same as HH\_ART\_RD\_TS\_SNAPSHOT\_LOW, offset 407000D0h.

#### 14.7.1.14 Revision ID (ISH\_MISC\_REVISION\_ID) – Offset 40700100h

This register provides information to ISH FW (Not accessible by any other entity) on the current ISH generation-revision.

Type	Size	Offset	Default
MMIO	32 bit	40700100h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000001h RO	<b>ISH_MISC_REVISION_ID:</b> This register provides information to ISH FW (Not accessible by any other entity) on the current ISH generation-revision.

#### 14.7.1.15 This Is Spare ROFor ECO. (ISH\_MISC\_ECO\_RO) – Offset 40700200h

This is spare RO register for ECO.

Type	Size	Offset	Default
MMIO	32 bit	40700200h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>ISH_MISC_ECO_RO:</b> This is spare RO register for ECO.

#### 14.7.1.16 This Is Spare RWFor ECO. (ISH\_MISC\_ECO\_RW) — Offset 40700204h

This is spare RW register for ECO.

Type	Size	Offset	Default
MMIO	32 bit	40700204h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	00000000h RW	<b>ISH_MISC_ECO_RW1:</b> This is spare RW register for ECO.
0	0h RW	<b>ISH_MISC_ECO_RW2:</b> 1: Disable adsnn fix Please refer ISH FSB2OCP MAS Address Strobing 0: Enable adsnn fix [5190654] [Address on FSB needs to be assumed to be VALID only during ADS#] ( <a href="https://vthsd.intel.com/hsd/seg_softip/bug/default.aspx?bug_id=5190654">https://vthsd.intel.com/hsd/seg_softip/bug/default.aspx?bug_id=5190654</a> )

#### 14.7.1.17 This Is Spare RW1CFor ECO (ISH\_MISC\_ECO\_RW1C) — Offset 40700208h

This is spare RW1C register for ECO.

Type	Size	Offset	Default
MMIO	32 bit	40700208h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	<b>ISH_MISC_ECO_RW1C:</b> This is spare RW1C register for ECO.

#### 14.7.1.18 This Is Spare Retention RWFor ECO. (ISH\_MISC\_ECO\_RET\_RW) – Offset 4070020Ch

This is spare Retention RW register for ECO. Bit 0 is used for enabling NMI on SRAM DED error.

Type	Size	Offset	Default
MMIO	32 bit	4070020Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	00000000h RW	<b>ISH_MISC_ECO_RET_RW:</b> This is spare Retention RW register for ECO.
0	0h RW	<b>NMI Enable On SRAM DED Error (ISH_SRAMDED_NMI_EN):</b> Bit 0: When 1, enables the NMI status generation in ISH_NMI_STATUS bit 0 on SRAM DED error . When 0, disables the NMI status generation in ISH_NMI_STATUS bit 0 on SRAM DED error.

#### 14.7.1.19 This Is Spare Retention RW1CFor ECO. (ISH\_MISC\_ECO\_RET\_RW1C) – Offset 40700210h

This is spare Retention RW1C register for ECO.

Type	Size	Offset	Default
MMIO	32 bit	40700210h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/1C	<b>ISH_MISC_ECO_RET_RW1C:</b> This is spare Retention RW1C register for ECO.

#### 14.7.1.20 AON Timestamp Control0 (ISH\_AON\_TIMESTAMP\_CTRL0) – Offset 40700220h

Control Register for AON Timestamp 0.

Type	Size	Offset	Default
MMIO	32 bit	40700220h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>BUSY:</b> Indicates Enable signal has been received by timestamp module. FW should wait for busy to match enable before changing enable.
30:13	0h RO	<b>Reserved</b>
12:8	00h RW	<b>GPIO Select (ISH_TIMESTAMP_GPIO_SEL_REG):</b> Selects GPIO pin to be timestamped.
7:2	0h RO	<b>Reserved</b>
1	0h RW	<b>Edge Detect (ISH_TIMESTAMP_EDGE_DETECT_REG):</b> GPIO Edge for capturing timestamp. 0: Falling edge, 1 : Rising Edge.
0	0h RW	<b>Timestamp Enable (ISH_TIMESTAMP_EN):</b> Setting this bit enables the timestamp.

#### 14.7.1.21 AON Timestamp Capture LOWregister0 (ISH\_AON\_TIMESTAMP\_LOW0) – Offset 40700224h

AON Timestamp capture low for AON Timestamp 0.

Type	Size	Offset	Default
MMIO	32 bit	40700224h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Timestamp Low (ISH_TIMESTAMP_LOW):</b> LSB 32bits of timestamp capture value. Valid when Timestamp status is 1.

#### 14.7.1.22 AON Timestamp Control HIGH0 (ISH\_AON\_TIMESTAMP\_HIGH0) – Offset 40700228h

AON Timestamp capture high for AON Timestamp 0.

Type	Size	Offset	Default
MMIO	32 bit	40700228h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>Timestamp High (ISH_TIMESTAMP_HIGH):</b> MSB 32bits of timestamp capture value. Valid when Timestamp status is 1.

#### 14.7.1.23 AON Timestamp Control STATUS0 (ISH\_AON\_TIMESTAMP\_STATUS0) – Offset 4070022Ch

Status Register for AON Timestamp 0.

Type	Size	Offset	Default
MMIO	32 bit	4070022Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW/1C	<b>ISH_TIMESTAMP_STATUS:</b> Timestamp status being 1 indicates an GPIO edge has been timestamped.

#### 14.7.1.24 AON Timestamp Control1 (ISH\_AON\_TIMESTAMP\_CTRL1) – Offset 40700230h

Control Register for AON Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

#### 14.7.1.25 AON Timestamp Capture LOWregister1 (ISH\_AON\_TIMESTAMP\_LOW1) – Offset 40700234h

AON Timestamp capture low for AON Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

#### 14.7.1.26 AON Timestamp Control HIGH1 (ISH\_AON\_TIMESTAMP\_HIGH1) – Offset 40700238h

AON Timestamp capture high for AON Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

#### 14.7.1.27 AON Timestamp Control STATUS1 (ISH\_AON\_TIMESTAMP\_STATUS1) – Offset 4070023Ch

Status Register for AON Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

#### 14.7.1.28 AON Timestamp Control2 (ISH\_AON\_TIMESTAMP\_CTRL2) – Offset 40700240h

Control Register for AON Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.29 AON Timestamp Capture LOWregister2  
(ISH\_AON\_TIMESTAMP\_LOW2) – Offset 40700244h**

AON Timestamp capture low for AON Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.30 AON Timestamp Control HIGH2 (ISH\_AON\_TIMESTAMP\_HIGH2) –  
Offset 40700248h**

AON Timestamp capture high for AON Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.31 AON Timestamp Control STATUS2 (ISH\_AON\_TIMESTAMP\_STATUS2)  
– Offset 4070024Ch**

Status Register for AON Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.32 AON Timestamp Control3 (ISH\_AON\_TIMESTAMP\_CTRL3) – Offset  
40700250h**

Control Register for AON Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.33 AON Timestamp Capture LOWregister3  
(ISH\_AON\_TIMESTAMP\_LOW3) – Offset 40700254h**

AON Timestamp capture low for AON Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.34 AON Timestamp Control HIGH3 (ISH\_AON\_TIMESTAMP\_HIGH3) –  
Offset 40700258h**

AON Timestamp capture high for AON Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.35 AON Timestamp Control STATUS3 (ISH\_AON\_TIMESTAMP\_STATUS3)  
– Offset 4070025Ch**

Status Register for AON Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.36 RTC Timestamp Control0 (ISH\_RTC\_TIMESTAMP\_CTRL0) – Offset  
40700260h**

Control Register for RTC Timestamp 0.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.37 RTC Timestamp Capture LOWregister0 (ISH\_RTC\_TIMESTAMP\_LOW0) — Offset 40700264h**

RTC Timestamp capture low for RTC Timestamp 0.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.38 RTC Timestamp Control HIGH0 (ISH\_RTC\_TIMESTAMP\_HIGH0) — Offset 40700268h**

RTC Timestamp capture high for RTC Timestamp 0.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.39 RTC Timestamp Control STATUS0 (ISH\_RTC\_TIMESTAMP\_STATUS0) — Offset 4070026Ch**

Status Register for RTC Timestamp 0.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.40 RTC Timestamp Control1 (ISH\_RTC\_TIMESTAMP\_CTRL1) — Offset 40700270h**

Control Register for RTC Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.41 RTC Timestamp Capture LOWregister1 (ISH\_RTC\_TIMESTAMP\_LOW1) — Offset 40700274h**

RTC Timestamp capture low for RTC Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.42 RTC Timestamp Control HIGH1 (ISH\_RTC\_TIMESTAMP\_HIGH1) — Offset 40700278h**

RTC Timestamp capture high for RTC Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.43 RTC Timestamp Control STATUS1 (ISH\_RTC\_TIMESTAMP\_STATUS1) — Offset 4070027Ch**

Status Register for RTC Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.44 RTC Timestamp Control2 (ISH\_RTC\_TIMESTAMP\_CTRL2) — Offset 40700280h**

Control Register for RTC Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.45 RTC Timestamp Capture LOWregister2 (ISH\_RTC\_TIMESTAMP\_LOW2) — Offset 40700284h**

RTC Timestamp capture low for RTC Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.46 RTC Timestamp Control HIGH2 (ISH\_RTC\_TIMESTAMP\_HIGH2) — Offset 40700288h**

RTC Timestamp capture high for RTC Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.47 RTC Timestamp Control STATUS2 (ISH\_RTC\_TIMESTAMP\_STATUS2) — Offset 4070028Ch**

Status Register for RTC Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.48 RTC Timestamp Control3 (ISH\_RTC\_TIMESTAMP\_CTRL3) — Offset 40700290h**

Control Register for RTC Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.49 RTC Timestamp Capture LOWregister3 (ISH\_RTC\_TIMESTAMP\_LOW3) — Offset 40700294h**

RTC Timestamp capture low for RTC Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.50 RTC Timestamp Control HIGH3 (ISH\_RTC\_TIMESTAMP\_HIGH3) — Offset 40700298h**

RTC Timestamp capture high for RTC Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.51 RTC Timestamp Control STATUS3 (ISH\_RTC\_TIMESTAMP\_STATUS3) — Offset 4070029Ch**

Status Register for RTC Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.52 XTAL Timestamp Control0 (ISH\_XTAL\_TIMESTAMP\_CTRL0) — Offset 407002A0h**

Control Register for XTAL Timestamp 0.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.53 XTAL Timestamp Capture LOWregister0  
(ISH\_XTAL\_TIMESTAMP\_LOW0) – Offset 407002A4h**

XTAL Timestamp capture low for XTAL Timestamp 0.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.54 XTAL Timestamp Control HIGH0 (ISH\_XTAL\_TIMESTAMP\_HIGH0) –  
Offset 407002A8h**

XTAL Timestamp capture high for XTAL Timestamp 0.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.55 XTAL Timestamp Control STATUS0 (ISH\_XTAL\_TIMESTAMP\_STATUS0)  
– Offset 407002ACh**

Status Register for XTAL Timestamp 0.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.56 XTAL Timestamp Control1 (ISH\_XTAL\_TIMESTAMP\_CTRL1) – Offset  
407002B0h**

Control Register for XTAL Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.57 XTAL Timestamp Capture LOWregister1  
(ISH\_XTAL\_TIMESTAMP\_LOW1) – Offset 407002B4h**

XTAL Timestamp capture low for XTAL Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.58 XTAL Timestamp Control HIGH1 (ISH\_XTAL\_TIMESTAMP\_HIGH1) –  
Offset 407002B8h**

XTAL Timestamp capture high for XTAL Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.59 XTAL Timestamp Control STATUS1 (ISH\_XTAL\_TIMESTAMP\_STATUS1)  
– Offset 407002BCh**

Status Register for XTAL Timestamp 1.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.60 XTAL Timestamp Control2 (ISH\_XTAL\_TIMESTAMP\_CTRL2) – Offset  
407002C0h**

Control Register for XTAL Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.61 XTAL Timestamp Capture LOWregister2  
(ISH\_XTAL\_TIMESTAMP\_LOW2) – Offset 407002C4h**

XTAL Timestamp capture low for XTAL Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.62 XTAL Timestamp Control HIGH2 (ISH\_XTAL\_TIMESTAMP\_HIGH2) – Offset 407002C8h**

XTAL Timestamp capture high for XTAL Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.63 XTAL Timestamp Control STATUS2 (ISH\_XTAL\_TIMESTAMP\_STATUS2) – Offset 407002CCh**

Status Register for XTAL Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.64 XTAL Timestamp Control2 (ISH\_XTAL\_TIMESTAMP\_CTRL3) – Offset 407002D0h**

Control Register for XTAL Timestamp 2.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_CTRL0, offset 40700220h.

**14.7.1.65 XTAL Timestamp Capture LOWregister3  
(ISH\_XTAL\_TIMESTAMP\_LOW3) – Offset 407002D4h**

XTAL Timestamp capture low for XTAL Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_LOW0, offset 40700224h.

**14.7.1.66 XTAL Timestamp Control HIGH3 (ISH\_XTAL\_TIMESTAMP\_HIGH3) – Offset 407002D8h**

XTAL Timestamp capture high for XTAL Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_HIGH0, offset 40700228h.

**14.7.1.67 XTAL Timestamp Control STATUS3 (ISH\_XTAL\_TIMESTAMP\_STATUS3) – Offset 407002DCh**

Status Register for XTAL Timestamp 3.

**Note:** Bit definitions are the same as ISH\_AON\_TIMESTAMP\_STATUS0, offset 4070022Ch.

**14.7.1.68 N Value For M/N Of XTAL Timer (HH\_ART\_TIMER0\_N\_VAL) – Offset 40700300h**

N value for M/N of XTAL Timer.

Type	Size	Offset	Default
MMIO	32 bit	40700300h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000001h RW	<b>HH_ART_TIMER0_N_VAL:</b> FW needs to configure the N value of the M/N ratio which specifies the timer clock rate relative to the 19.2M PMC art clock.

#### 14.7.1.69 N Value For M/N Of AON Timer (HH\_ART\_TIMER1\_N\_VAL) – Offset 40700304h

N value for M/N of AON Timer.

Type	Size	Offset	Default
MMIO	32 bit	40700304h	00000019h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000019h RW	<b>HH_ART_TIMER1_N_VAL:</b> FW needs to configure the N value of the M/N ratio which specifies the timer clock rate relative to the 19.2M PMC art clock.

#### 14.7.1.70 N Value For M/N Of RTC Timer (HH\_ART\_TIMER2\_N\_VAL) – Offset 40700308h

N value for M/N of RTC Timer.

Type	Size	Offset	Default
MMIO	32 bit	40700308h	00008000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00008000h RW	<b>HH_ART_TIMER2_N_VAL:</b> FW needs to configure the N value of the M/N ratio which specifies the timer clock rate relative to the 19.2M PMC art clock.

#### 14.7.1.71 Quotient For M/N Of XTAL Timer (HH\_ART\_TIMER0\_MN\_QUOTIENT) – Offset 40700310h

Quotient for M/N of XTAL Timer.

Type	Size	Offset	Default
MMIO	32 bit	40700310h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000001h RW	<b>HH_ART_TIMER0_MN_QUOTIENT:</b> FW needs to configure the Quotient of the M/N ratio which specifies the timer clock rate relative to the 19.2M PMC art clock.

#### 14.7.1.72 Quotient For M/N Of AON Timer (HH\_ART\_TIMER1\_MN\_QUOTIENT) – Offset 40700314h

Quotient for M/N of AON Timer.

Type	Size	Offset	Default
MMIO	32 bit	40700314h	00000007h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000007h RW	<b>HH_ART_TIMER1_MN_QUOTIENT:</b> FW needs to configure the Quotient of the M/N ratio which specifies the timer clock rate relative to the 19.2M PMC art clock.

#### 14.7.1.73 Quotient For M/N Of RTC Timer (HH\_ART\_TIMER2\_MN\_QUOTIENT) – Offset 40700318h

Quotient for M/N of RTC Timer.

Type	Size	Offset	Default
MMIO	32 bit	40700318h	00000249h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000249h RW	<b>HH_ART_TIMER2_MN_QUOTIENT:</b> FW needs to configure the Quotient of the M/N ratio which specifies the timer clock rate relative to the 19.2M PMC art clock.

#### 14.7.1.74 Remainder For M/N Of XTAL Timer (HH\_ART\_TIMER0\_MN\_REMAINDER) – Offset 40700320h

Remainder for M/N of XTAL Timer.

Type	Size	Offset	Default
MMIO	32 bit	40700320h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>HH_ART_TIMER0_MN_REMAINDER:</b> FW needs to configure the Remainder of the M/N ratio which specifies the timer clock rate relative to the 19.2M PMC art clock.

#### 14.7.1.75 Remainder For M/N Of AON Timer (**HH\_ART\_TIMER1\_MN\_REMAINDER**) — Offset 40700324h

Remainder for M/N of AON Timer.

Type	Size	Offset	Default
MMIO	32 bit	40700324h	00000011h

Register Level Access:

BIOS Access	SMM Access	OS Access

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000011h RW	<b>HH_ART_TIMER1_MN_REMAINDER:</b> FW needs to configure the Remainder of the M/N ratio which specifies the timer clock rate relative to the 19.2M PMC art clock.

#### 14.7.1.76 Remainder For M/N Of RTC Timer (**HH\_ART\_TIMER2\_MN\_REMAINDER**) — Offset 40700328h

Remainder for M/N of RTC Timer.

Type	Size	Offset	Default
MMIO	32 bit	40700328h	00007800h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00007800h RW	<b>HH_ART_TIMER2_MN_REMAINDER:</b> FW needs to configure the Remainder of the M/N ratio which specifies the timer clock rate relative to the 19.2M PMC art clock.

#### 14.7.1.77 MISC\_PROXYMODE\_REG\_GBE1 – Offset 40700330h

Proxy mode reg for GBE1.

Type	Size	Offset	Default
MMIO	32 bit	40700330h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW/1C	<b>PROXY_MODE_BIT:</b> Proxymode reg for GBE 1, set when entering network proxy. HW set from mirror reg in GBE misc. Cleared by FW.

#### 14.7.1.78 MISC\_PROXYMODE\_REG\_GBE2 – Offset 40700334h

Proxy mode reg for GBE2.

Type	Size	Offset	Default
MMIO	32 bit	40700334h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW/1C	<b>PROXY_MODE_BIT:</b> Proxymode reg for GBE 2, set when entering network proxy. HW set from mirror reg in GBE misc. Cleared by FW.

#### 14.7.1.79 MISC\_PROXYMODE\_ENTRY\_INT\_STS — Offset 40700338h

Proxy mode intr reg for both GBE1 & GB2.

Type	Size	Offset	Default
MMIO	32 bit	40700338h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>PROXY_MODE_ENTRY_STS_MASK2:</b> Entry sts reg interrupt mask.
2	0h RW	<b>PROXY_MODE_ENTRY_STS_MASK1:</b> Entry sts reg interrupt mask.
1	0h RW/1C	<b>PROXY_MODE_ENTRY_STS_2:</b> Entry sts reg of proxymode, it when posedge is seen in GBE_proxy_mode reg. Cleared by FW.
0	0h RW/1C	<b>PROXY_MODE_ENTRY_STS_1:</b> Entry sts reg of proxymode, it when posedge is seen in GBE_proxy_mode reg. Cleared by FW.

#### 14.7.1.80 ARM DFX Secure Feature Status (OSE\_ARM\_DFX\_SECURE\_STS) — Offset 4070033Ch

ARM DFX Secure Feature status for FW read.

Type	Size	Offset	Default
MMIO	32 bit	4070033Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RO	<b>OSE_ARM_DFX_SECURE_STATUS:</b> This bit is set, when either of the policy selected : Policy 2 (Security Unlocked) , Policy 4 (Intel Unlocked), Policy 5 (OEM Unlocked).

#### 14.7.1.81 ARM AHBS Select (OSE\_ARM\_AHBS\_SEL\_ADDR) — Offset 40700340h

AHBS Select.

Type	Size	Offset	Default
MMIO	32 bit	40700340h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RO/V	<b>AHBSRDY:</b> AHBSRDYOutput Indicates when the AHBS is ready to accept transactions.
0	0h RW	<b>AHSPRI:</b> Input Indicates that the AHBS or software access takes priority LOW -Software access takes priority over AHBS access, HIGHAHBS access takes priority over software access.

#### 14.7.1.82 Reg\_Ose\_sram\_region1\_base (SRAM\_REGION\_1\_BASE) — Offset 40700400h

This register has to be programmed by firmware to configure region 1 start address/base address in SRAM I2 that can be accessed by host.

Type	Size	Offset	Default
MMIO	32 bit	40700400h	60000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	60h RW	<b>Ose_sram_region1_base 24 To 31 (SRAM_RGN1_BASE_PRG2):</b> This can be programmed.
23:16	00h RW	<b>Ose_sram_region1_base 16 To 23 (SRAM_RGN1_BASE_PRG1):</b> This can be programmed.
15:10	00h RW	<b>Ose_sram_region1_base 10 To 15 (SRAM_RGN1_BASE_PRG0):</b> This can be programmed.
9:0	000h RO	<b>Non Accessable Bits 9 To 0 (SRAM_RGN1_BASE_NON):</b> These are non accessible bits.

#### 14.7.1.83 Reg Ose\_sram\_region1\_size (SRAM\_REGION\_1\_SIZE) — Offset 40700404h

This register needs to be programmed by firmware to configure the offset/size for the region 1 in SRAM I2 that can be accessed by HOST. The protection region is not present when SIZE=0. When SIZE>0, the size of the protection region is calculated as  $((2^{(SIZE-1)})*(2^{10}))$ .

Type	Size	Offset	Default
MMIO	32 bit	40700404h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:3	00h RW	<b>Ose_sram_region1_size 3 To 7 (SRAM_RGN1_SIZE_PRG):</b> This can be programmed.
2:0	0h RO	<b>Ose_sram_region1_size 0 To 2 (SRAM_RGN1_SIZE_NON):</b> These are non accessible bits.

#### 14.7.1.84 Reg Ose\_sram\_region2\_base (SRAM\_REGION\_2\_BASE) – Offset 40700408h

This register has to be programmed by firmware to configure region 2 start address/base address in SRAM I2 that can be accessed by host.

Type	Size	Offset	Default
MMIO	32 bit	40700408h	60000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	60h RW	<b>Ose_sram_region2_base 24 To 31 (SRAM_RGN2_BASE_PRG2):</b> This can be programmed.
23:16	00h RW	<b>Ose_sram_region2_base 16 To 23 (SRAM_RGN2_BASE_PRG1):</b> This can be programmed.
15:10	00h RW	<b>Ose_sram_region2_base 10 To 15 (SRAM_RGN2_BASE_PRG0):</b> This can be programmed.
9:0	000h RO	<b>Non Accessible Bits 9 To 0 (SRAM_RGN2_BASE_NON):</b> These are non accessible bits.

#### 14.7.1.85 Reg Ose\_sram\_region2\_size (SRAM\_REGION\_2\_SIZE) – Offset 4070040Ch

This register needs to be programmed by firmware to configure the offset/size for the region 2 in SRAM I2 that can be accessed by HOST. The protection region is not present when SIZE=0. When SIZE>0, the size of the protection region is calculated as  $((2^{(SIZE-1)})*(2^{10}))$ .

Type	Size	Offset	Default
MMIO	32 bit	4070040Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:3	00h RW	<b>Ose_sram_region2_size 3 To 7 (SRAM_RGN2_SIZE_PRG):</b> This can be programmed.
2:0	0h RO	<b>Ose_sram_region2_size 0 To 2 (SRAM_RGN2_SIZE_NON):</b> These are non accessible bits.

#### 14.7.1.86 Reg Ose\_sram\_region3\_base (SRAM\_REGION\_3\_BASE) — Offset 40700410h

This register has to be programmed by firmware to configure region 3 start address/base address in SRAM I2 that can be accessed by host.

Type	Size	Offset	Default
MMIO	32 bit	40700410h	60000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	60h RW	<b>Ose_sram_region3_base 24 To 31 (SRAM_RGN3_BASE_PRG2):</b> This can be programmed.
23:16	00h RW	<b>Ose_sram_region3_base 16 To 23 (SRAM_RGN3_BASE_PRG1):</b> This can be programmed.
15:10	00h RW	<b>Ose_sram_region3_base 10 To 15 (SRAM_RGN3_BASE_PRG0):</b> This can be programmed.
9:0	000h RO	<b>Non Accessable Bits 9 To 0 (SRAM_RGN3_BASE_NON):</b> These are non accessible bits.

#### 14.7.1.87 Reg Ose\_sram\_region3\_size (SRAM\_REGION\_3\_SIZE) — Offset 40700414h

This register needs to be programmed by firmware to configure the offset/size for the region 2 in SRAM I2 that can be accessed by HOST. The protection region is not present when SIZE=0. When SIZE>0, the size of the protection region is calculated as  $((2^{(SIZE-1)})*(2^{10}))$ .

Type	Size	Offset	Default
MMIO	32 bit	40700414h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:3	00h RW	<b>Ose_sram_region3_base 3 To 7 (SRAM_RGN3_SIZE_PRG):</b> This can be programmed.
2:0	0h RO	<b>Ose_sram_region3_base 0 To 2 (SRAM_RGN3_SIZE_NON):</b> These are non accessible bits.

#### 14.7.1.88 Reg Ose\_sram\_region4\_base (SRAM\_REGION\_4\_BASE) — Offset 40700418h

This register has to be programmed by firmware to configure region 4 start address/base address in SRAM I2 that can be accessed by host.

Type	Size	Offset	Default
MMIO	32 bit	40700418h	60000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	60h RW	<b>Ose_sram_region4_base 24 To 31 (SRAM_RGN4_BASE_PRG2):</b> This can be programmed.

2	0h RO	<b>Reserved</b>
1	0h RO	<b>AONRF_MEM_TOCP_TPMDATA:</b> Parity log for aonrf_mem_tocp_tpMData.
0	0h RO	<b>DEVICE_IDLE_REG_TOCP_TPMDATA:</b> Parity log for device_idle_reg_tocp_tpMData.

#### 14.7.1.91 FUSA\_PERO FABRIC PARITY\_LOG (FUSA\_PERO\_FABRIC\_PARITY\_LOG) – Offset 40700804h

Parity error for PERO fabric.

Type	Size	Offset	Default
MMIO	32 bit	40700804h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	<b>Reserved</b>
25	0h RO	<b>PERO_FABRIC_IOPC_IPSDATA:</b> Parity log for wdt_reg_tocp_tpMData.
24	0h RO	<b>WDT_REG_TOCP_TPMDATA:</b> Parity log for sbep_reg_tocp_tpMData.
23	0h RO	<b>SBEP_REG_TOCP_TPMDATA:</b> Parity log for pmu_reg_tocp_tpMData.
22	0h RO	<b>PMU_REG_TOCP_TPMDATA:</b> Parity log for sec_reg_tocp_tpMData.
21	0h RO	<b>SEC_REG_TOCP_TPMDATA:</b> Parity log for att_reg_tocp_tpMData.
20	0h RO	<b>ATT_REG_TOCP_TPMDATA:</b> Parity log for misc_reg_tocp_tpMData.
19	0h RO	<b>MISC_REG_TOCP_TPMDATA:</b> Parity log for ip_dashboard_reg_tocp_tpMData.
18	0h RO	<b>IP_DASHBOARD_REG_TOCP_TPMDATA:</b> Parity log for ipc_reg_tocp_tpMData.
17	0h RO	<b>IPC_REG_TOCP_TPMDATA:</b> Parity log for i2c7_per_tapb_tppwdata.
16	0h RO	<b>I2C7_PER_TAPB_TPPWDATA:</b> Parity log for i2c6_per_tapb_tppwdata.
15	0h RO	<b>I2C6_PER_TAPB_TPPWDATA:</b> Parity log for i2c5_per_tapb_tppwdata.
14	0h RO	<b>I2C5_PER_TAPB_TPPWDATA:</b> Parity log for i2c4_per_tapb_tppwdata.
13	0h RO	<b>I2C4_PER_TAPB_TPPWDATA:</b> Parity log for i2c3_per_tapb_tppwdata.
12	0h RO	<b>I2C3_PER_TAPB_TPPWDATA:</b> Parity log for i2c2_per_tapb_tppwdata.
11	0h RO	<b>I2C2_PER_TAPB_TPPWDATA:</b> Parity log for i2c1_per_tapb_tppwdata.
10	0h RO	<b>I2C1_PER_TAPB_TPPWDATA:</b> Parity log for i2c0_per_tapb_tppwdata.
9	0h RO	<b>I2C0_PER_TAPB_TPPWDATA:</b> Parity log for pll_reg_tapb_tppwdata.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	<b>PLL_REG_TAPB TPPWDATA:</b> Parity log for hpet_reg_tocp_tpMData.
7	0h RO	<b>HPET_REG_TOCP_TPMDATA:</b> Parity log for tgpio1_per_tocp_tpMData.
6	0h RO	<b>TGPIO1_PER_TOCP_TPMDATA:</b> Parity log for tgpio0_per_tocp_tpMData.
5	0h RO	<b>TGPIO0_PER_TOCP_TPMDATA:</b> Parity log for gpio1_per_tapb_tppwdata.
4	0h RO	<b>GPIO1_PER_TAPB TPPWDATA:</b> Parity log for gpio0_per_tapb_tppwdata.
3	0h RO	<b>GPIO0_PER_TAPB TPPWDATA:</b> Parity log for dtf_reg_tocp_tpMData.
2	0h RO	<b>DTF_REG_TOCP_TPMDATA:</b> Parity log for ccu_reg_tocp_tpMData.
1	0h RO	<b>CCU_REG_TOCP_TPMDATA:</b> Parity log for device_idle_reg_tocp_tpMData.
0	0h RO	<b>DEVICE_IDLE_REG_TOCP_TPMDATA:</b> Parity log for device_idle_reg_tocp_tpMData.

#### 14.7.1.92 FUSA\_PER1 FABRIC PARITY\_LOG (FUSA\_PER1\_FABRIC\_PARITY\_LOG) – Offset 40700808h

Parity error for PER1 fabric.

Type	Size	Offset	Default
MMIO	32 bit	40700808h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20	0h RO	<b>QEP3_PER_TAPB TPPWDATA:</b> Parity log for qep3_per_tapb_tppwdata.
19	0h RO	<b>QEP2_PER_TAPB TPPWDATA:</b> Parity log for qep2_per_tapb_tppwdata.
18	0h RO	<b>QEP1_PER_TAPB TPPWDATA:</b> Parity log for qep1_per_tapb_tppwdata.
17	0h RO	<b>QEPO_PER_TAPB TPPWDATA:</b> Parity log for qep0_per_tapb_tppwdata.
16	0h RO	<b>ADCO_PER_TAHB_TPHWDATA:</b> Parity log for adc0_per_tahb_tphwdata.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	<b>PWM1_PER_TAPB TPPWDATA:</b> Parity log for pwm1_per_tapb_tppwdata.
14	0h RO	<b>PWM0_PER_TAPB TPPWDATA:</b> Parity log for pwm0_per_tapb_tppwdata.
13	0h RO	<b>I2S1_PER_TAPB TPPWDATA:</b> Parity log for i2s1_per_tapb_tppwdata.
12	0h RO	<b>I2S0_PER_TAPB TPPWDATA:</b> Parity log for i2s0_per_tapb_tppwdata.
11	0h RO	<b>SPI3_PER_TAPB TPPWDATA:</b> Parity log for spi3_per_tapb_tppwdata.
10	0h RO	<b>SPI2_PER_TAPB TPPWDATA:</b> Parity log for spi2_per_tapb_tppwdata.
9	0h RO	<b>SPI1_PER_TAPB TPPWDATA:</b> Parity log for spi1_per_tapb_tppwdata.
8	0h RO	<b>SPI0_PER_TAPB TPPWDATA:</b> Parity log for spi0_per_tapb_tppwdata.
7	0h RO	<b>UART5_PER_TAPB TPPWDATA:</b> Parity log for uart5_per_tapb_tppwdata.
6	0h RO	<b>UART4_PER_TAPB TPPWDATA:</b> Parity log for uart4_per_tapb_tppwdata.
5	0h RO	<b>UART3_PER_TAPB TPPWDATA:</b> Parity log for uart3_per_tapb_tppwdata.
4	0h RO	<b>UART2_PER_TAPB TPPWDATA:</b> Parity log for uart2_per_tapb_tppwdata.
3	0h RO	<b>UART1_PER_TAPB TPPWDATA:</b> Parity log for uart1_per_tapb_tppwdata.
2	0h RO	<b>UART0_PER_TAPB TPPWDATA:</b> Parity log for uart0_per_tapb_tppwdata.
1	0h RO	<b>PER1_FABRIC_IOC_PSDATA:</b> Parity log for per1_fabric_ioc_ipSData.
0	0h RO	<b>DEVICE_IDLE_0_REG_TOCP_TPMDATA:</b> Parity log for device_idle_0_reg_toCP_tpMData.

#### 14.7.1.93 FUSA\_MEM PARITY\_LOG (FUSA\_MEM\_PARITY\_LOG) – Offset 4070080Ch

Parity error for different memories fabric.

Type	Size	Offset	Default
MMIO	32 bit	4070080Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RO	<b>ERROR_LOG_DATA_READ_DATA_CACHE:</b> Fatal error on data read for Data Cache.
6	0h RO	<b>ERROR_LOG_TAG_READ_DATA_CACHE:</b> Fatal error on tag read for Data Cache.
5	0h RO	<b>ERROR_LOG_DATA_READ_INSTRUCTION_CACHE:</b> Fatal error on data read for Instruction Cache.
4	0h RO	<b>ERROR_LOG_TAG_READ_INSTRUCTION_CACHE:</b> Fatal error on tag read for Instruction Cache.
3	0h RO	<b>Reserved</b>
2	0h RO	<b>BOOT_ROM_PARITY:</b> Boot ROM parity odd Error bit.
1	0h RO	<b>AON_RF_PARITY:</b> AON RF parity odd Error bit.
0	0h RO	<b>SRAMDED_ERROR:</b> SRAM DED error bit.

#### 14.7.1.94 FUSA\_ARM DC ERROR\_LOG (FUSA\_ARM\_DC\_ERROR\_LOG) – Offset 40700810h

This register reports information about the current status of the Data cache Error Bank Registers(DEBR), which of these Error Bank Registers have been allocated to this cycle, and information about any allocation that has occurred.

Type	Size	Offset	Default
MMIO	32 bit	40700810h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	<b>Reserved</b>
21	0h RO	<b>DEBR1 Locked (DEBR1_LOCKED):</b> Indicates whether DEBR1 is locked.
20	0h RO	<b>DEBR1 Valid (DEBR1_VALID):</b> Indicates whether DEBR1 is valid.
19	0h RO	<b>DEBRO Locked. (DEBRO_LOCKED):</b> Indicates whether DEBRO is loked . 0 - Not Loked , 1 -Locked. No hardware allocations.
18	0h RO	<b>DEBRO Valid. (DEBRO_VALID):</b> Indicates whether DEBRO is valid.
17:2	0000h RO	<b>Data Allocation (DATA_ALLOCATION):</b> Data to be allocated. Corresponds to bits [17:2] of data to be written to Error Bank Register. Only valid when DCERR[1:0] is not b00.
1:0	0h RO	<b>Allocation Status (ALLOCATION_STATUS):</b> Allocation status. 00 - No allocation,10 Allocation into DEBRO,11 - Allocation into DEBR1,01 - attempted allocation but both entries are locked. Will not allocate.

#### 14.7.1.95 FUSA\_ARM\_IC\_ERROR\_LOG (FUSA\_ARM\_IC\_ERROR\_LOG) — Offset 40700814h

This register reports information about the current status of the instruction cache Error Bank Registers(IEBR), which of these Error Bank Registers have been allocated to this cycle, and information about any allocation that has occurred.

Type	Size	Offset	Default
MMIO	32 bit	40700814h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	<b>Reserved</b>
21	0h RO	<b>IEBR1 Locked (IEBR1_LOCKED):</b> Indicates whether IEBr1 is locked.
20	0h RO	<b>IEBR1 Valid (IEBR1_VALID):</b> Indicates whether IEBr1 is valid.
19	0h RO	<b>IEBRO Locked. (IEBRO_LOCKED):</b> Indicates whether IEBro is loked . 0 - Not Loked , 1 -Locked. No hardware allocations.
18	0h RO	<b>IEBRO Valid. (IEBRO_VALID):</b> Indicates whether IEBro is valid.
17:2	0000h RO	<b>Data Allocation (DATA_ALLOCATION):</b> Data to be allocated. Corresponds to bits [17:2] of data to be written to Error Bank Register. Only valid when ICERR[1:0] is not b00.
1:0	0h RO	<b>Allocation Status (ALLOCATION_STATUS):</b> Allocation status. 00 - No allocation,10 Allocation into IEBro,11 - Allocation into IEBr1,01 - attempted allocation but both entries are locked. Will not allocate.

#### 14.7.1.96 FUSA\_BRIDGE\_PARTY\_LOGO (FUSA\_BRIDGE\_PARTY\_LOG0) – Offset 40700818h

This register is clear when FUSA\_CTRL.LOG\_CLR is set to 1. Set when there is a data parity error for PCI function [31:0].

Type	Size	Offset	Default
MMIO	32 bit	40700818h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>FUSA_BRIDGE_PARTY_LOG0:</b> This register is clear when FUSA_CTRL.LOG_CLR is set to 1. Set when there is a data parity error for PCI function [31:0].

#### 14.7.1.97 FUSA\_BRIDGE\_PARTY\_LOG1 (FUSA\_BRIDGE\_PARTY\_LOG1) – Offset 4070081Ch

This register is clear when FUSA\_CTRL.LOG\_CLR is set to 1. Set when there is a data parity error for PCI function [36:32].

Type	Size	Offset	Default
MMIO	32 bit	4070081Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RO	<b>FUSA_BRIDGE_PARTY_LOG1:</b> This register is clear when FUSA_CTRL.LOG_CLR is set to 1. Set when there is a data parity error for PCI function [36:32].

#### 14.7.1.98 FUSA CONTROL (FUSA\_CTRL) – Offset 40700820h

Fusa control register.

Type	Size	Offset	Default
MMIO	32 bit	40700820h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>FABRIC_PARITY_DISABLE:</b> Disables Fabric parity check. Also clear fabric parity log registers. It may take upto 5 clks to clear. Check FUSA_*_FABRIC_PARITY_LOG registers to confirm when it is cleared.
0	0h RW	<b>LOG_CLR:</b> Clears log other than fabric fusa parity.

#### 14.7.1.99 ISH\_FW\_ALIVE – Offset 40700900h

On raising NMI, FW needs to write pattern 0xDEADBEEF into this register before ish\_fw\_timer expires. If FW is not alive and timer expires, global reset is issued.

Type	Size	Offset	Default
MMIO	32 bit	40700900h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>ISH_FW_ALIVE:</b> On raising NMI, FW needs to write pattern 0xDEADBEEF into this register before ish_fw_timer expires. If FW is not alive and timer expires, global reset is issued.

#### 14.7.1.100 ISH\_FW\_TIMEOUT – Offset 40700904h

On raising NMI, down counter starts with ish\_fw\_timeout value. FW needs to write pattern before counter expires.

Type	Size	Offset	Default
MMIO	32 bit	40700904h	000186A0h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	000186A0h RW	<b>ISH_FW_TIMEOUT:</b> On raising NMI, down counter starts with ish_fw_timeout value. FW needs to write pattern before counter expires.

#### 14.7.1.101 ISH\_NMI\_STATUS – Offset 40700908h

Indicates NMI to ARM.

Type	Size	Offset	Default
MMIO	32 bit	40700908h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RW/1C	<b>DMA UR From Psf (DMA_UR_INTR):</b> DMA resp error from PSF in ARM owned mode. In host owned mode, this bit internally tied to '0'.
3	0h RW/1C	<b>Cpu Exception Intr (CPU_EXCEPTION_INTR):</b> ARM lockup, fpixc, fpidc, fpofc, fpufc, fpdzc, fpioc errors.
2	0h RO	<b>Reserved</b>
1	0h RW/1C	<b>Wdt Expiry Intr (WDT_EXP_INTR):</b> Sram ecc, fabric parity, aon_rf parity , brom parity errors.
0	0h RW/1C	<b>Ecc Parity Intr (ECC_PARITY_INTR):</b> Bridge parity error.

## 14.8 SBEP Registers

SBEP Registers	Address Offset	Table
SBEP	40800000h - 40800084h	Table 13-18

### 14.8.1 SBEP Registers Summary

Table 14-18. Summary of SBEP Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40800000h	4	Attribute Reg (DS_ATTRIBUTES)	00000000h
40800004h	4	Address Reg LO (DS_ADDRESS_LSB)	00000000h
40800008h	4	Address Reg HI (DS_ADDRESS_MSB)	00000000h
4080000Ch	4	Extended Header (SAIRS) (DS_SAI)	00000000h
40800010h	4	Received Data (DS_DATA_IN)	00000000h
40800014h	4	Control And Status (DS_CONTROL_STATUS)	00000000h
40800018h	4	ISH Source Port ID (DS_SOURCEPORTID)	00000000h
40800020h	4	Completion Data (DS_CMP_DATA)	00000000h
40800024h	4	Completion SAI (DS_CMP_SAI)	00000000h
40800028h	4	Completion Status And Control (DS_CMP_STATUS)	00000000h
40800040h	4	Status Reg (US_STATUS)	00000000h
40800044h	4	Command Reg (US_COMMAND)	00000000h
40800048h	4	Target AddressLO (US_TARGET_LO)	00000000h
4080004Ch	4	Target AddressHI (US_TARGET_HIGH)	00000000h
40800050h	4	Target Out Data (US_TARGET_DATA)	00000000h
40800054h	4	Upstream Attribute (US_ATTRIBUTES)	00000000h
40800058h	4	Upstream Request SAIRS (US_SAIR)	80000000h
4080005Ch	4	Upstream Completion Data (US_CMP_DATA)	00000000h
40800060h	4	Upstream Completion Status And Control (US_CMP_STATUS_CONTROL)	00000000h
40800064h	4	Upstream Completion SAI (US_CMP_SAI)	00000034h
40800068h	4	SAI_WIDTH Reg (SAI_WIDTH)	00000007h
4080006Ch	4	Side Clk Gate Enable (SIDE_CLK_GATE_EN)	00000000h
40800074h	4	Received Data (DS_DATA_IN_DW2)	00000000h
40800080h	4	DN Access Valid Enable (DS_ACCESS_VALID_EN)	00000000h
40800084h	4	Boot Prep Control (BOOT_PREP_CONTROL_REG)	00000000h

#### 14.8.1.1 Attribute Reg (DS\_ATTRIBUTES) – Offset 40800000h

Attribute Register.

Type	Size	Offset	Default
MMIO	32 bit	40800000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved</b>
27:24	0h RO/V	<b>BYTE_ENABLE_OF_THE_DWORD:</b> Byte enables. First byte enables.
23:16	00h RO/V	<b>OPCODE_OF_MESSAGE:</b> Opcode of messages.
15:8	00h RO/V	<b>SOURCE_PORT_ID:</b> Source Port ID.
7:0	00h RO/V	<b>DESTINATION_PORT_ID:</b> Destination Port ID.

#### 14.8.1.2 Address Reg LO (DS\_ADDRESS\_LSB) — Offset 40800004h

Downstream Address Register LO.

Type	Size	Offset	Default
MMIO	32 bit	40800004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>ADDRESS_LSB:</b> Address[31:0].

#### 14.8.1.3 Address Reg HI (DS\_ADDRESS\_MSB) — Offset 40800008h

Downstream Address Register HI.

Type	Size	Offset	Default
MMIO	32 bit	40800008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	<b>Address Length (ADDRESS_LENGTH):</b> Indicates the length of the address field as follows: 0: 16-bit address 1: 48-bit address .
30:16	0h RO	<b>Reserved</b>
15:0	0000h RO/V	<b>ADDRESS_MSB:</b> Address[47:32].

#### 14.8.1.4 Extended Header (SAIRS) (DS\_SAI) — Offset 4080000Ch

Downstream Extended Header (SAIRS) Register.

Type	Size	Offset	Default
MMIO	32 bit	4080000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	<b>VALID:</b> EH Present SAI preset- when 1, 23:0 bits are valid.
30:20	0h RO	<b>Reserved</b>
19:16	0h RO/V	<b>ROOT_SPACE:</b> Root Space field received in message.
15:0	0000h RO/V	<b>SAI:</b> SAI Security attribute indicator.

#### 14.8.1.5 Received Data (DS\_DATA\_IN) — Offset 40800010h

Downstream Received Data Register.

Type	Size	Offset	Default
MMIO	32 bit	40800010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>DATA_RECEIVED:</b> Data received in message.

#### 14.8.1.6 Control And Status (DS\_CONTROL\_STATUS) – Offset 40800014h

Downstream Control and status Register.

Type	Size	Offset	Default
MMIO	32 bit	40800014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>MSG_RX_STATUS:</b> Message received interrupt - Message received interrupt status register. Written by HW and cleared HW itself when MinuteIA writes to upstream completion control register indicating completion is available. When cleared interrupt going to MinuteIA goes low.
30	0h RW	<b>INTERRUPT_MASK:</b> Interrupt mask register for message received interrupt. When set to 1 interrupt is not generated to MinuteIA. Mask does not affect interrupt status bit.
29:2	0h RO	<b>Reserved</b>
1:0	0h RO	<b>TYPE_OF_TRANSACTION:</b> Type of transaction: indicates type of transaction received as follows: 2 b001 : Posted message 2 b010 : Non-posted message 2 b1011: Completion message.

#### 14.8.1.7 ISH Source Port ID (DS\_SOURCEPORTID) – Offset 40800018h

Downstream Source Port ID.

Type	Size	Offset	Default
MMIO	32 bit	40800018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RO	<b>SOURCE_PORT_ID:</b> (Reset value is 0, straps will get loaded runtime) Source ID of ISH. Default value is coming from top level straps.

#### 14.8.1.8 Completion Data (DS\_CMP\_DATA) – Offset 40800020h

Downstream completion Data Register.

Type	Size	Offset	Default
MMIO	32 bit	40800020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>COMPLETION_DATA:</b> Completion data received for upstream non-posted read.

#### 14.8.1.9 Completion SAI (DS\_CMP\_SAI) – Offset 40800024h

Downstream Completion SAI Registers.

Type	Size	Offset	Default
MMIO	32 bit	40800024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	<b>COMPLETION_SAI:</b> Completion SAI received for upstream non-posted read.

#### 14.8.1.10 Completion Status And Control (DS\_CMP\_STATUS) – Offset 40800028h

Downstream Completion status and control Register.

Type	Size	Offset	Default
MMIO	32 bit	40800028h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	<b>COMPLETION_RECEIVED:</b> Completion received status register. Set by HW and cleared by FW by writing 1 to it.
30	0h RW	<b>INTERRUPT_MASK:</b> Interrupt mask register for completion received interrupt. When set to 1 interrupt is not generated to MinuteIA. Mask does not affect interrupt status bit.
29:9	0h RO	<b>Reserved</b>
8	0h RO	<b>DN_CMPL_EHPRESENT:</b> EH present for Downstream completion (ISH4 Only).
7:3	0h RO	<b>Reserved</b>
2:0	0h RO	<b>Completion Status (COMPLETION_STATUS):</b> 000: Successful Completion (SC) 001: Unsupported Request (UR).

#### 14.8.1.11 Status Reg (US\_STATUS) – Offset 40800040h

Upstream status register.

Type	Size	Offset	Default
MMIO	32 bit	40800040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW/1C	<b>Message Sent (MSG_SENT):</b> Upstream message sent interrupt status 1, Upstream message has been sent out. This is cleared FW by writing 1 to it.
0	0h RO	<b>SM Status (STATE_MACHINE_STATUS):</b> 1 = The Endpoint State Machine is busy. 0 = The Endpoint Status Machine is idle. This is OR of posted SM and NP SM busy signals.

#### 14.8.1.12 Command Reg (US\_COMMAND) — Offset 40800044h

Upstream Command Register.

Type	Size	Offset	Default
MMIO	32 bit	40800044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>Interrupt Enable (ENABLE_INTERRUPT):</b> 1 = Cause an interrupt when the transaction completes.
2	0h RW	<b>Message Type (TYPE_OF_MSG):</b> 1 = Transaction will be Posted 0 = Transaction will be non-posted will be hardcoded to 0 indicating NP message For posted message register (new) this field would be hardcoded to 1..
1	0h RW	<b>Transaction Command Type (TRANSACTION_TYPE):</b> 1 = Transaction will be a Read 0 = Transaction will be a Write For posted message register (new) this bit will be hardcoded to 0 as reads cannot be P .
0	0h RW	<b>SEND_IOSF_SB_TRANSACTION:</b> MinuteIA writes a 1 to this bit to cause an IOSF SB Transaction. The type of transaction is determined by Bit 1 in this register. *This bit will always be read as 0 but FW can write it to 1 to start the upstream transaction. In that way it won't be readable as 1 after writing to.

#### 14.8.1.13 Target AddressLO (US\_TARGET\_LO) – Offset 40800048h

Target Address Register LO.

Type	Size	Offset	Default
MMIO	32 bit	40800048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Address Low (ADDRESS_LOW):</b> Address of message. Offset within the Target's IOSF SB Port.

#### 14.8.1.14 Target AddressHI (US\_TARGET\_HIGH) – Offset 4080004Ch

Target Address Register HI.

Type	Size	Offset	Default
MMIO	32 bit	4080004Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>Address Length (ADDRESS_LENGTH):</b> Indicates the length of the address field as follows: 0: 16-bit address 1: 48-bit address.
30:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>Address MSB (ADDRESS_HIGH):</b> MSB 16 address bits, valid only when bit 31 is set to 1.

#### 14.8.1.15 Target Out Data (US\_TARGET\_DATA) – Offset 40800050h

Target Out data Register.

Type	Size	Offset	Default
MMIO	32 bit	40800050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>DATA_SENT:</b> The MinuteIA writes the data value that will be sent on the next write IOSF SB Transaction.

#### 14.8.1.16 Upstream Attribute (US\_ATTRIBUTES) — Offset 40800054h

Upstream Attribute Register.

Type	Size	Offset	Default
MMIO	32 bit	40800054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	<b>FID:</b> FID.
23:20	0h RW	<b>BAR:</b> BAR for upstream register access.
19:16	0h RW	<b>BYTE_ENABLE_FOR_THE_MSG:</b> Upstream byte enables. 19:16 FBE.
15:8	00h RW	<b>OPCODE:</b> Message Opcode. This Opcode will go as Opcode for upstream message.
7:0	00h RW	<b>DESTINATION_PORT_ID:</b> Destination ID of upstream message. For ex. If when the upstream message is targeted to PMC then FW writes to this register with destination ID of PMC.

#### 14.8.1.17 Upstream Request SAIRS (US\_SAIR) — Offset 40800058h

Upstream request SAIRS Register.

Type	Size	Offset	Default
MMIO	32 bit	40800058h	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	<b>EH Present (EH_PRESET):</b> Extended header present indication. When set to 1 indicates extended header is present. Currently tied to 1 in RTL as ISH supports only EH=1 transactions.
30:20	0h RO	<b>Reserved</b>
19:16	0h RW	<b>ROOT_SPACE:</b> Root space..
15:11	0h RO	<b>Reserved</b>
10:8	0h RW	<b>TAG:</b> Tag..
7:0	00h RO	<b>SAI_OF_IOSF_SBEP:</b> ISH SAI to be inserted in all upstream messages with if EH_present bit is set to 1. Reset value is 0, straps will get loaded runtime .

#### 14.8.1.18 Upstream Completion Data (US\_CMP\_DATA) — Offset 4080005Ch

Upstream Completion Data Register.

Type	Size	Offset	Default
MMIO	32 bit	4080005Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>COMPLETION_DATA:</b> Completion data to be used for upstream completion as a result of downstream read request. This field is valid only downstream when type of transfer register indicates non-posted type of transaction.

#### 14.8.1.19 Upstream Completion Status And Control (US\_CMP\_STATUS\_CONTROL) — Offset 40800060h

Upstream Completion status and control Register.

Type	Size	Offset	Default
MMIO	32 bit	40800060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/AC	<b>IOSF_SB_COMPLETION:</b> Upstream completion for Downstream request. MinuteIA writes a 1 to this bit to indicate downstream message received is consumed. This internally causes an IOSF SB completion Transaction if original downstream request is non-posted. If original message is posted then upstream completion is not generated by HW. to it. This bit cleared by HW.
30:3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>COMPLETION_STATUS:</b> Completion Status 000: Successful Completion (SC) 001: Unsupported Request (UR).

#### 14.8.1.20 Upstream Completion SAI (US\_CMP\_SAIR) — Offset 40800064h

Upstream completion SAI Register.

Type	Size	Offset	Default
MMIO	32 bit	40800064h	00000034h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	34h RO	<b>SAI_STRAP_FOR_COMPLETION:</b> SAI for ISH which will be inserted in upstream completion. Reset value is 0, straps will get loaded runtime .

#### 14.8.1.21 SAI\_WIDTH Reg (SAI\_WIDTH) — Offset 40800068h

Register for SAI\_WIDTH.

Type	Size	Offset	Default
MMIO	32 bit	40800068h	00000007h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	7h RO	<b>SAI_WIDTH:</b> Specifies the SAI Width value.

#### 14.8.1.22 Side Clk Gate Enable (SIDE\_CLK\_GATE\_EN) — Offset 4080006Ch

Register for Side clk gate enable.

Type	Size	Offset	Default
MMIO	32 bit	4080006Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>Trunk Clk Gate (JTAG_FORCE_CLKREQ):</b> 0: Clk request enable 1: Clk is gated.
0	0h RW	<b>Local Clk Gate (CG_CTRL_CLKGATEDEF):</b> 0: Clk is un-gated 1: Clk is gated.

#### 14.8.1.23 Received Data (DS\_DATA\_IN\_DW2) — Offset 40800074h

Downstream Received Data Register DW2.

Type	Size	Offset	Default
MMIO	32 bit	40800074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>Data Received (DATA_RECEIVED):</b> Data received in message. DW2.

#### 14.8.1.24 DN Access Valid Enable (DS\_ACCESS\_VALID\_EN) — Offset 40800080h

Downstream access valid enable.

Type	Size	Offset	Default
MMIO	32 bit	40800080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	00000000h RO	<b>DS_ACCESS_VALID_EN_RSVD:</b> Reserved
0	0h RW	<b>Access Valid Enable For DS (ACCESS_VALID_ENABLE):</b> Downstream messages PMC access valid Enable: This bit is set by ISH FW to enable SBEPM HW to accept downstream cycles from PMC, Hammock Harbor ART agent, Audio, ISP, CSME, GPIO, DFX Trusted0 Red2, DFX Trusted1 Red4, DFX Trusted2 Orange and interrupt ISH upon such an event. Note that ISH HW chooses the SAI value corresponding to this agent. NOTE: If a BOOTPREP message is received, ISH FW is interrupted unconditionally, i.e. irrespective of this bit being 1 or 0. .

#### 14.8.1.25 Boot Prep Control (BOOT\_PREP\_CONTROL\_REG) — Offset 40800084h

BOOT PREP CONTROL register.

Type	Size	Offset	Default
MMIO	32 bit	40800084h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW/C	<b>Boot Prep Received Status (BOOT_PREP_RECEIVED_STATUS):</b> This bit is set by SBEP HW upon the reception of Boot Prep message. ISH FW is required to clear this status bit by writing 0, upon issuing Boot Prep Ack message on the upstream path of SBEP HW. SBEP HW will clear this bit, upon auto ack ing of Boot Prep due to timeout condition.

## 14.9 DTF Registers

DTF Registers	Address Offset	Table
DTF	40900000h - 4090000Ch	Table 13-19

### 14.9.1 DTF Registers Summary

Table 14-19. Summary of DTF Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40900000h	4	DTF Packetizer Source Configuration (PCKTZR_DTF_SRC_CONFIG)	00000000h
40900004h	4	DTF Packetizer Source Status (PCKTZR_DTF_SRC_STATUS)	00000000h
40900008h	4	DTF Encoder Source Config (ENCDR_DTF_SRC_CONFIG)	00000000h
4090000Ch	4	DTF Encoder Source Status (ENCDR_DTF_SRC_STATUS)	00000000h

#### 14.9.1.1 DTF Packetizer Source Configuration (PCKTZR\_DTF\_SRC\_CONFIG) – Offset 40900000h

This register allow software enabling of the individual source, as well as software specification of the trace aggregator destination.

Type	Size	Offset	Default
MMIO	32 bit	40900000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2	0h RW	<b>Encoder Clock Gating Override (ENC(CG_OVRD)):</b> Encoder clock gating override.
1	0h RW	<b>Destination ID (DEST_ID):</b> This bit specifies which trace aggregator to use.
0	0h RW	<b>Source Enable (SRC_EN):</b> Enable for source packetizer.

#### 14.9.1.2 DTF Packetizer Source Status (PCKTZR\_DTF\_SRC\_STATUS) – Offset 40900004h

This register allow software discovery and debug of the master and channel ID produced by this source packetizer.

Type	Size	Offset	Default
MMIO	32 bit	40900004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>BUSY:</b> If set, encoder is not in a state to accept data from packetiser.
30	0h RO	<b>Encoder FIFO Empty (ENC_FIFO_EMPTY):</b> This bit is set when encoder indicates FIFO empty.
29	0h RO	<b>Arbiter Empty (ARBITER_EMPTY):</b> This bit is set when the empty signal from arbiter is asserted.
28	0h RO	<b>Encoder Active (ENC_ACTIVE):</b> This bit is set when the active signal from encoder is asserted.
27:18	0h RO	<b>Reserved</b>
17:16	0h RO	<b>Timestamp Bit Shift Value (TS_BIT_SHFT_VAL):</b> Bit shift value for FW inserted TS driven by SOC.
15:8	00h RO	<b>Channel ID (CHNL_ID):</b> Channel ID.
7:0	00h RO	<b>Master ID (MSTR_ID):</b> Master ID.

#### 14.9.1.3 DTF Encoder Source Config (ENCDR\_DTF\_SRC\_CONFIG) – Offset 40900008h

This register to allow some survivability and debug-ability if there is an issue in the DTF.

Type	Size	Offset	Default
MMIO	32 bit	40900008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:3	0h RW	<b>Pattern Selected (PATT_SEL):</b> Select pattern for Debug.
2	0h RW	<b>Pattern Enable (PATT_EN):</b> Pattern generation enabled.
1	0h RW	<b>EOF Control Enable (EOF_EN):</b> EOF Control Enable.
0	0h RW	<b>Credit Control Enable (IGNORE_CR):</b> Credit Control Enable.

#### 14.9.1.4 DTF Encoder Source Status (ENCDR\_DTF\_SRC\_STATUS) — Offset 4090000Ch

This register is to provides information on states of the different FSMs and signals that are critical to the encoder functionality.

Type	Size	Offset	Default
MMIO	32 bit	4090000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:13	0h RO	<b>Count Valid Out (CNT_VALID_OUT):</b> Cnt_valid_out signal.
12:10	0h RO	<b>Valid Count (VALID_CNT):</b> Valid_cnt signal.
9	0h RO	<b>D_FIFO_S:</b> D_FIFO_s signal.
8	0h RO	<b>DTFE_UPSTREAM_CREDIT:</b> Dtfte_upstream_credit signal.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	<b>DRAIN:</b> Drain signal.
6	0h RO	<b>Fifo Valid (FIFO_VALID):</b> Fifo_valid signal.
5	0h RO	<b>TS:</b> Ts signal.
4	0h RO	<b>FIFO_WR_INT:</b> Fifo_wr_int signal.
3	0h RO	<b>FIFO_RD_INT:</b> Fifo_rd_int signal.
2	0h RO	<b>EOF:</b> EOF signal.
1	0h RO	<b>TXID_UCI:</b> Txid signal.
0	0h RO	<b>CREDIT_OK:</b> Credit_ok signal can send ds data.

## 14.10 HPET Registers

HPET Registers	Address Offset	Table
HPET	40A00000h - 40A00160h	Table 13-20

## 14.10.1 HPET Registers Summary

**Table 14-20. Summary of HPET Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40A00000h	4	General Capabilities And ID (GCID_LOW)	8086A201h
40A00004h	4	General Capabilities And ID (GCID_HIGH)	01D1A94Ah
40A00010h	4	General Configuration (GCFG_LOW)	00000000h
40A00014h	4	General Configuration (GCFG_HIGH)	00000000h
40A00020h	4	General Interrupt Status (GIS_LOW)	00000000h
40A00024h	4	General Interrupt Status (GIS_HIGH)	00000000h
40A000F0h	4	Main Counter Value (MCV_LOW)	00000000h
40A000F4h	4	Main Counter Value (MCV_HIGH)	00000000h
40A00100h	4	Timer N Config And Capabilities (T0C_LOW)	00000030h
40A00104h	4	Timer N Config And Capabilities (T0C_HIGH)	00F00000h
40A00108h	4	Timer N Comparator Value (T0CV_LOW)	FFFFFFFh
40A0010Ch	4	Timer N Comparator Value (T0CV_HIGH)	FFFFFFFh
40A00120h	4	Timer N Config And Capabilities (T1C_LOW)	00000000h
40A00124h	4	Timer N Config And Capabilities (T1C_HIGH)	00F00000h
40A00128h	4	Timer N Comparator Value (T1CV_LOW)	FFFFFFFh
40A00140h	4	Timer N Config And Capabilities (T2C_LOW)	00000000h
40A00144h	4	Timer N Config And Capabilities (T2C_HIGH)	00F00800h
40A00148h	4	Timer N Comparator Value (T2CV_LOW)	FFFFFFFh
40A00160h	4	HPET Control And Status (HPET_CTRL_STS)	80000000h

### 14.10.1.1 General Capabilities And ID (GCID\_LOW) – Offset 40A00000h

HPET\_GCID : Vendor ID (VID): Value of 8086h indicates Intel.

Type	Size	Offset	Default
MMIO	32 bit	40A00000h	8086A201h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	8086h RO	<b>Vendor ID (VID):</b> Value of 8086h indicates Intel.
15	1h RO	<b>Legacy Rout Capable (LRC):</b> Indicates support for Legacy Interrupt Rout.
14	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
13	1h RO	<b>Counter Size (CS):</b> Indicates support for Legacy Interrupt Rout.
12:8	02h RO	<b>Number Of Timers (NT):</b> Indicates that 3 timers are supported.
7:0	01h RO	<b>Revision ID (RID):</b> Indicates that revision 1.0 of the specification is implemented.

#### 14.10.1.2 General Capabilities And ID (GCID\_HIGH) – Offset 40A00004h

HPET\_GCID : Counter Tick Period (CTP): Indicates the clock period.

Type	Size	Offset	Default
MMIO	32 bit	40A00004h	01D1A94Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	01D1A94Ah RO	<b>Counter Tick Period (CTP):</b> ISH2: Specified in picoseconds. Indicates a period of 1000000 ps, (1 MHz clock period) ISH3: Specified in picoseconds. Indicates a period of 83333 ps, (12 MHz clock period) ISH4: Specified in picoseconds. Indicates a period of 30517578 ps (32.768 KHz clock period) .

#### 14.10.1.3 General Configuration (GCFG\_LOW) – Offset 40A00010h

HPET\_GCFG : Reserved.

Type	Size	Offset	Default
MMIO	32 bit	40A00010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW/V	<b>Overall Enable (EN) (LRE):</b> When set, interrupts will be routed as follows: Timer 0 will be routed to IRQ0 in 8259 or IRQ2 in the I/O APIC . Timer 1 will be routed to IRQ8 in 8259 and I/O APIC. Timer 2 will be routed as per the routing in T2C When set, the TNC.IR will have no impact for timers 0 and 1. For ISH, this bit needs to be set for routing HPET1 interrupt.
0	0h RW/V	<b>Overall Enable (EN):</b> When set, the timers can generate interrupts. When cleared, the main counter will halt and no interrupts will be caused by any timer. For level-triggered interrupts, if an interrupt is pending when this bit is cleared, the GIS.Tx will not be cleared.

#### 14.10.1.4 General Configuration (GCFG\_HIGH) – Offset 40A00014h

HPET\_GCFG : Reserved.

Type	Size	Offset	Default
MMIO	32 bit	40A00014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	<b>Reserved</b>

#### 14.10.1.5 General Interrupt Status (GIS\_LOW) – Offset 40A00020h

HPET\_GIS.

Type	Size	Offset	Default
MMIO	32 bit	40A00020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2	0h RW/V	<b>Timer 2 Status (T2) (T2):</b> Same functionality as T0, for timer 2.
1	0h RW/V	<b>Timer 1 Status (T1) (T1):</b> Same functionality as T0, for timer 1.
0	0h RW/V	<b>Timer 0 Status (T0) (T0):</b> In edge triggered mode, this bit always reads as 0. In level triggered mode, this bit is set when an interrupt is active.

#### 14.10.1.6 General Interrupt Status (GIS\_HIGH) — Offset 40A00024h

HPET\_GIS.

**Note:** Bit definitions are the same as GCFG\_HIGH, offset 40A00014h.

#### 14.10.1.7 Main Counter Value (MCV\_LOW) — Offset 40A000F0h

HPET\_MCV : Counter Value (CV): Reads return the current value of the counter. Writes load the new value to the counter. Timers 1 and 2 return 0 for the upper 32-bits of this register.

Type	Size	Offset	Default
MMIO	32 bit	40A000F0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>Counter Value (CV (MCV_LOW):</b> Reads return the current value of the counter. Writes load the new value to the counter. Timers 1 and 2 return 0 for the upper 32-bits of this register.

#### 14.10.1.8 Main Counter Value (MCV\_HIGH) – Offset 40A000F4h

HPET\_MCV : Counter Value (CV): Reads return the current value of the counter. Writes load the new value to the counter. Timers 1 and 2 return 0 for the upper 32-bits of this register.

Type	Size	Offset	Default
MMIO	32 bit	40A000F4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/V	<b>Counter Value (CV (MCV_HIGH)):</b> Reads return the current value of the counter. Writes load the new value to the counter. Timers 1 and 2 return 0 for the upper 32-bits of this register.

#### 14.10.1.9 Timer N Config And Capabilities (T0C\_LOW) – Offset 40A00100h

HPET\_T0C : reserved.

Type	Size	Offset	Default
MMIO	32 bit	40A00100h	00000030h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	0h RO	<b>FSB Interrupt Delivery (FID) (FID):</b> Not supported.
14	0h RO	<b>FSB Enable (FE) (FE):</b> Not supported, since FID is not supported.
13:9	00h RW/V	<b>Interrupt Rout (IR) (IR):</b> This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum value of 32 interrupts is supported. Default is 00h. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timer's interrupt. If the value is not supported by this particular timer, then the value read back will not match what is written. The software must only write valid values.. If GC.LRE is set, then Timers 0 and 1 have a fixed routing, and this field has no effect. For ISH, Timer 2 interrupt need to be routed only through IRQ 11. This field needs to be 0bh. .

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/V	<b>Timer 32-Bit Mode (T32M) (T32M):</b> When set, this bit forces a 64-bit timer to behave as a 32-bit timer. For timer 0, this bit will be read/write and default to 0. For timers 1 and 2, this bit is read only 0 .
7	0h RO	<b>Reserved</b>
6	0h RW/V	<b>Timer Value Set (TVS) (TVS):</b> This bit will return 0 when read. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1 and 2.
5	1h RO	<b>Timer Size (TS) (TS):</b> 1 = 64-bits, 0 = 32-bits. Set for timer 0. Cleared for timers 1 and 2.
4	1h RO	<b>Periodic Interrupt Capable (PIC) (PIC):</b> When set, hardware supports a periodic mode for this timer's interrupt. This bit is set for timer 0, and cleared for timers 1 and 2.
3	0h RW/V	<b>Timer Type (TYP) (TYP):</b> If PIC is set, this bit is read/write, and can be used to enable the timer to generate a periodic interrupt. This bit is RW for timer 0, and RO for timers 1 and 2.
2	0h RW/V	<b>Interrupt Enable (IE) (IE):</b> When set, enables the timer to cause an interrupt when it times out. When cleared, the timer count and generates status bits, but will not cause an interrupt.
1	0h RW/V	<b>Timer Interrupt Type (IT) (IT):</b> When cleared, interrupt is edge triggered. When set, interrupt is level triggered and will be held active until it is cleared by writing 1 to GIS.Tn. If another interrupt occurs before the interrupt is cleared, the interrupt remains active. For ISH, this bit needs to be 0 always to generate edge-sensitive interrupts from all 3 HEPT Timers.
0	0h RO	<b>Reserved</b>

#### 14.10.1.10 Timer N Config And Capabilities (T0C\_HIGH) — Offset 40A00104h

HPET\_T0C : Interrupt Rout Capability (IRC): Indicates IOxAPIC interrupts the timer can use: Timer 0,1: 00f00000h. Indicates support for IRQ20, 21, 22, 23 Timer 2: 00f00800h. Indicates support for IRQ11.

Type	Size	Offset	Default
MMIO	32 bit	40A00104h	00F00000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00F00000h RO	<b>Interrupt Rout Capability (IRC) (IRC):</b> Indicates I/OxAPIC interrupts the timer can use: Timer 0,1: 00f00000h. Indicates support for IRQ20, 21, 22, 23. Timer 2: 00f00800h. Indicates support for IRQ11, IRQ20, 21, 22, 23 .

#### 14.10.1.11 Timer N Comparator Value (T0CV\_LOW) – Offset 40A00108h

HPET\_T0CV Reads to this register return the current value of the comparator. The default value for each timer is all 1s for the bits that are implemented. Timer 0 is 64-bits wide. Timers 1 and 2 are 32-bits wide.

Type	Size	Offset	Default
MMIO	32 bit	40A00108h	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description

## 14.11 WDT Registers

WDT Registers	Address Offset	Table
WDT	40B00000h - 40B00008h	Table 13-21

### 14.11.1 WDT Registers Summary

Table 14-21. Summary of WDT Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40B00000h	4	WDT Control (WDTC)	0000A0A0h
40B00004h	4	WDT Reload (WDTR)	00000000h
40B00008h	4	WDT Values (WDTV)	0000A0A0h

#### 14.11.1.1 WDT Control (WDTC) — Offset 40B00000h

WDT control register. Used for Enabling the WDT and Loading timeout values.

Type	Size	Offset	Default
MMIO	32 bit	40B00000h	0000A0A0h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	<b>Reserved</b>
17	0h RW	<b>WDT_EN:</b> Enables the watchdog timer.
16	0h RO	<b>Reserved</b>
15:8	A0h RW	<b>Load Value For T2 Counter (WDT_T2):</b> The value loaded at the beginning of the T2 state.
7:0	A0h RW	<b>Load Value For T1 Counter (WDT_T1):</b> The value loaded at the beginning of the T1 state.

#### 14.11.1.2 WDT Reload (WDTR) — Offset 40B00004h

WDT Reload register. When reload is set to 1, the hardware reloads the counters to the values in WDT\_T1 and WDT\_T2 fields.

Type	Size	Offset	Default
MMIO	32 bit	40B00004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>WDT_RL:</b> Reload. When firmware writes a 1 to this bit, the hardware reloads the counters to the values in WDT_T1 and WDT_T2 fields. The hardware will auto-clear this bit, so it will always read as a 0.

#### 14.11.1.3 WDT Values (WDTV) — Offset 40B00008h

WDT Values register. Current values of T1 and T2 counter can be read from this register.

Type	Size	Offset	Default
MMIO	32 bit	40B00008h	0000A0A0h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:8	A0h RO	<b>Current Value Of T2 Counter (WDT_T2_VAL):</b> Current values of the T2 counter (The actual timer, counting down).
7:0	A0h RO	<b>Current Value Of T1 Counter (WDT_T1_VAL):</b> Current values of the T1 counter (The actual timer, counting down).

#### 14.12.1.1 Control Policy Low (OSE\_SEC\_REG\_LOW) — Offset 40C00000h

LSB 32 bit Register for configuring Control Policy.

Type	Size	Offset	Default
MMIO	32 bit	40C00000h	01200010h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	01200010h RO	Control Policy (LOW): Bits 31:0.

#### 14.12.1.2 Control Policy High (OSE\_SEC\_REG\_HIGH) — Offset 40C00004h

MSB 32 bit Register for configuring Control Policy.

Type	Size	Offset	Default
MMIO	32 bit	40C00004h	00000C00h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000C00h RO	<b>Control Policy (HIGH):</b> Bits 63:32.

#### 14.12.1.3 OSE\_OWNED\_IP\_RAC\_LOW – Offset 40C00008h

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### 14.12.1.4 OSE\_OWNED\_IP\_RAC\_HIGH – Offset 40C0000Ch

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### 14.12.1.5 OSE\_OWNED\_IP\_WAC\_LOW – Offset 40C00010h

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### 14.12.1.6 OSE\_OWNED\_IP\_WAC\_HIGH – Offset 40C00014h

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### 14.12.1.7 OSE\_LH\_OWNED\_IP\_RAC\_LOW – Offset 40C00018h

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### 14.12.1.8 OSE\_LH\_OWNED\_IP\_RAC\_HIGH – Offset 40C0001Ch

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### 14.12.1.9 OSE\_LH\_OWNED\_IP\_WAC\_LOW – Offset 40C00020h

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.10 OSE\_LH\_OWNED\_IP\_WAC\_HIGH – Offset 40C00024h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.11 NULL\_OWNED\_IP\_RAC\_LOW – Offset 40C00028h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.12 NULL\_OWNED\_IP\_RAC\_HIGH – Offset 40C0002Ch**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.13 NULL\_OWNED\_IP\_WAC\_LOW – Offset 40C00030h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.14 NULL\_OWNED\_IP\_WAC\_HIGH – Offset 40C00034h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.15 LH2OSE\_IPC\_OS\_REGION\_RAC\_LOW – Offset 40C00038h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.16 LH2OSE\_IPC\_OS\_REGION\_RAC\_HIGH – Offset 40C0003Ch**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.17 LH2OSE\_IPC\_OS\_REGION\_WAC\_LOW – Offset 40C00040h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.18 LH2OSE\_IPC\_OS\_REGION\_WAC\_HIGH – Offset 40C00044h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.19 LH2OSE\_IPC BIOS REGION RAC\_LOW – Offset 40C00048h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.20 LH2OSE\_IPC BIOS REGION RAC\_HIGH – Offset 40C0004Ch**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.21 LH2OSE\_IPC BIOS REGION WAC\_LOW – Offset 40C00050h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.22 LH2OSE\_IPC BIOS REGION WAC\_HIGH – Offset 40C00054h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.23 OSE\_SRAM\_LH2OSE\_REG1\_REGION\_RAC\_LOW – Offset 40C00058h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.24 OSE\_SRAM\_LH2OSE\_REG1\_REGION\_RAC\_HIGH – Offset 40C0005Ch**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.25 OSE\_SRAM\_LH2OSE\_REG1\_REGION\_WAC\_LOW – Offset 40C00060h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.26 OSE\_SRAM\_LH2OSE\_REG1\_REGION\_WAC\_HIGH – Offset 40C00064h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.27 OSE\_SRAM\_LH2OSE\_REG2\_REGION\_RAC\_LOW – Offset 40C00068h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.28 OSE\_SRAM\_LH2OSE\_REG2\_REGION\_RAC\_HIGH — Offset 40C0006Ch**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.29 OSE\_SRAM\_LH2OSE\_REG2\_REGION\_WAC\_LOW — Offset 40C00070h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.30 OSE\_SRAM\_LH2OSE\_REG2\_REGION\_WAC\_HIGH — Offset 40C00074h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.31 OSE\_SRAM\_LH2OSE\_REG3\_REGION\_RAC\_LOW — Offset 40C00078h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.32 OSE\_SRAM\_LH2OSE\_REG3\_REGION\_RAC\_HIGH — Offset 40C0007Ch**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.33 OSE\_SRAM\_LH2OSE\_REG3\_REGION\_WAC\_LOW — Offset 40C00080h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.34 OSE\_SRAM\_LH2OSE\_REG3\_REGION\_WAC\_HIGH — Offset 40C00084h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.35 OSE\_LH2OSE\_SRAM\_GBEPROXY\_REGION\_RAC\_LOW — Offset 40C00088h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.36 OSE\_LH2OSE\_SRAM\_GBEPROXY\_REGION\_RAC\_HIGH — Offset 40C0008Ch**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.37 OSE\_LH2OSE\_SRAM\_GBEPROXY\_REGION\_WAC\_LOW – Offset 40C00090h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.38 OSE\_LH2OSE\_SRAM\_GBEPROXY\_REGION\_WAC\_HIGH – Offset 40C00094h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.39 OSE\_CSE\_IPC\_RAC\_LOW – Offset 40C00098h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.40 OSE\_CSE\_IPC\_RAC\_HIGH – Offset 40C0009Ch**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.41 OSE\_CSE\_IPC\_WAC\_LOW – Offset 40C000A0h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.42 OSE\_CSE\_IPC\_WAC\_HIGH – Offset 40C000A4h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.43 OSE\_PMC\_IPC\_RAC\_LOW – Offset 40C000A8h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.44 OSE\_PMC\_IPC\_RAC\_HIGH – Offset 40C000ACh**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.45 OSE\_PMC\_IPC\_WAC\_LOW – Offset 40C000B0h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.46 OSE\_PMC\_IPC\_WAC\_HIGH – Offset 40C000B4h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.47 OSE\_AUDIO\_IPC\_RAC\_LOW – Offset 40C000B8h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.48 OSE\_AUDIO\_IPC\_RAC\_HIGH – Offset 40C000BCh**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.49 OSE\_AUDIO\_IPC\_WAC\_LOW – Offset 40C000C0h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.50 OSE\_AUDIO\_IPC\_WAC\_HIGH – Offset 40C000C4h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.51 OSE\_SBEP\_WAC\_LOW – Offset 40C000C8h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.52 OSE\_SBEP\_WAC\_HIGH – Offset 40C000CCh**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

#### **14.12.1.53 OSE\_SBEP\_BOOTPREP\_WAC\_LOW – Offset 40C000D0h**

LSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_LOW, offset 40C00000h.

#### **14.12.1.54 OSE\_SBEP\_BOOTPREP\_WAC\_HIGH – Offset 40C000D4h**

MSB 32 bit Register for configuring Policy/Range.

**Note:** Bit definitions are the same as OSE\_SEC\_REG\_HIGH, offset 40C00004h.

## 14.13 ATT Registers

ATT Registers	Address Offset	Table
ATT	40E00000h - 40E0001FCh	Table 13-23

### 14.13.1 ATT Registers Summary

Table 14-23. Summary of ATT Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40E00000h	4	MMIO BASE VALUE For Entry 0 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_0)	80000001h
40E00004h	4	MMIO BASE VALUE For Entry 0 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_0)	80001000h
40E00008h	4	OCP Translate Offset For Entry 0 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_0)	40400000h
40E0000Ch	4	OCP Translate Mask For Entry 0 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_0)	FFFF0000h
40E00010h	4	MMIO BASE VALUE For Entry 1 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_1)	80004001h
40E00014h	4	MMIO BASE VALUE For Entry 1 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_1)	80006000h
40E00018h	4	OCP Translate Offset For Entry 1 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_1)	40F00000h
40E0001Ch	4	OCP Translate Mask For Entry 1 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_1)	FFFE000h
40E00020h	4	MMIO BASE VALUE For Entry 2 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_2)	80006001h
40E00024h	4	MMIO BASE VALUE For Entry 2 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_2)	80007000h
40E00028h	4	OCP Translate Offset For Entry 2 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_2)	40C00000h
40E0002Ch	4	OCP Translate Mask For Entry 2 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_2)	FFFE000h
40E00030h	4	MMIO BASE VALUE For Entry 3 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_3)	80010001h
40E00034h	4	MMIO BASE VALUE For Entry 3 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_3)	80014000h
40E00038h	4	OCP Translate Offset For Entry 3 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_3)	40410000h
40E0003Ch	4	OCP Translate Mask For Entry 3 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_3)	FFFF0000h
40E00040h	4	MMIO BASE VALUE For Entry 4 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_4)	80100000h
40E00044h	4	MMIO BASE VALUE For Entry 4 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_4)	80104000h
40E00048h	4	OCP Translate Offset For Entry 4 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_4)	60000000h
40E0004Ch	4	OCP Translate Mask For Entry 4 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_4)	FFFF0000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40E00050h	4	MMIO BASE VALUE For Entry 5 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_5)	80200001h
40E00054h	4	MMIO BASE VALUE For Entry 5 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_5)	80220000h
40E00058h	4	OCP Translate Offset For Entry 5 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_5)	50200000h
40E0005Ch	4	OCP Translate Mask For Entry 5 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_5)	FFFE0000h
40E00060h	4	MMIO BASE VALUE For Entry 6 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_6)	80220000h
40E00064h	4	MMIO BASE VALUE For Entry 6 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_6)	80240000h
40E00068h	4	OCP Translate Offset For Entry 6 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_6)	60000000h
40E0006Ch	4	OCP Translate Mask For Entry 6 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_6)	FFFE0000h
40E00070h	4	MMIO BASE VALUE For Entry 7 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_7)	80400001h
40E00074h	4	MMIO BASE VALUE For Entry 7 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_7)	80420000h
40E00078h	4	OCP Translate Offset For Entry 7 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_7)	50220000h
40E0007Ch	4	OCP Translate Mask For Entry 7 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_7)	FFFE0000h
40E00080h	4	MMIO BASE VALUE For Entry 8 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_8)	80420000h
40E00084h	4	MMIO BASE VALUE For Entry 8 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_8)	80440000h
40E00088h	4	OCP Translate Offset For Entry 8 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_8)	60000000h
40E0008Ch	4	OCP Translate Mask For Entry 8 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_8)	FFFE0000h
40E00090h	4	MMIO BASE VALUE For Entry 9 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_9)	00000000h
40E00094h	4	MMIO BASE VALUE For Entry 9 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_9)	00000000h
40E00098h	4	OCP Translate Offset For Entry 9 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_9)	00000000h
40E0009Ch	4	OCP Translate Mask For Entry 9 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_9)	00000000h
40E000A0h	4	MMIO BASE VALUE For Entry 10 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_10)	00000000h
40E000A4h	4	MMIO BASE VALUE For Entry 10 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_10)	00000000h
40E000A8h	4	OCP Translate Offset For Entry 10 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_10)	00000000h
40E000ACh	4	OCP Translate Mask For Entry 10 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_10)	00000000h
40E000B0h	4	MMIO BASE VALUE For Entry 11 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_11)	00000000h
40E000B4h	4	MMIO BASE VALUE For Entry 11 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_11)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40E000B8h	4	OCP Translate Offset For Entry 11 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_11)	00000000h
40E000BCh	4	OCP Translate Mask For Entry 11 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_11)	00000000h
40E000C0h	4	MMIO BASE VALUE For Entry 12 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_12)	00000000h
40E000C4h	4	MMIO BASE VALUE For Entry 12 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_12)	00000000h
40E000C8h	4	OCP Translate Offset For Entry 12 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_12)	00000000h
40E000CCh	4	OCP Translate Mask For Entry 12 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_12)	00000000h
40E000D0h	4	MMIO BASE VALUE For Entry 13 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_13)	00000000h
40E000D4h	4	MMIO BASE VALUE For Entry 13 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_13)	00000000h
40E000D8h	4	OCP Translate Offset For Entry 13 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_13)	00000000h
40E000DCh	4	OCP Translate Mask For Entry 13 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_13)	00000000h
40E000E0h	4	MMIO BASE VALUE For Entry 14 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_14)	00000000h
40E000E4h	4	MMIO BASE VALUE For Entry 14 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_14)	00000000h
40E000E8h	4	OCP Translate Offset For Entry 14 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_14)	00000000h
40E000ECh	4	OCP Translate Mask For Entry 14 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_14)	00000000h
40E000F0h	4	MMIO BASE VALUE For Entry 15 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_15)	00000000h
40E000F4h	4	MMIO BASE VALUE For Entry 15 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_15)	00000000h
40E000F8h	4	OCP Translate Offset For Entry 15 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_15)	00000000h
40E000FCh	4	OCP Translate Mask For Entry 15 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_15)	00000000h
40E00100h	4	MMIO BASE VALUE For Entry 16 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_16)	00000000h
40E00104h	4	MMIO BASE VALUE For Entry 16 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_16)	00000000h
40E00108h	4	OCP Translate Offset For Entry 16 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_16)	00000000h
40E0010Ch	4	OCP Translate Mask For Entry 16 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_16)	00000000h
40E00110h	4	MMIO BASE VALUE For Entry 17 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_17)	00000000h
40E00114h	4	MMIO BASE VALUE For Entry 17 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_17)	00000000h
40E00118h	4	OCP Translate Offset For Entry 17 (ISH_DS_OCP_ATT_OCP_XLATE_OFFSET_REG_ENTRY_17)	00000000h
40E0011Ch	4	OCP Translate Mask For Entry 17 (ISH_DS_OCP_ATT_OCP_XLATE_MASK_REG_ENTRY_17)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40E00120h	4	MMIO BASE VALUE For Entry 18 (ISH_DS_OCP_ATT_MMIO_BASE_REG_ENTRY_18)	00000000h
40E00124h	4	MMIO BASE VALUE For Entry 18 (ISH_DS_OCP_ATT_MMIO_LIMIT_REG_ENTRY_18)	00000000h

### 14.13.1.1 MMIO BASE VALUE For Entry 0 (ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0) – Offset 40E00000h

MMIO BASE VALUE for entry 0.

Type	Size	Offset	Default
MMIO	32 bit	40E00000h	80000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	80000h RW	<b>MMIO_BASE_VALUE:</b> This defines the MMIO Base (4K aligned address offset) value.
11:1	0h RO	<b>Reserved</b>
0	1h RW	<b>VALID:</b> Valid: This defines that this entry is valid.

### 14.13.1.2 MMIO BASE VALUE For Entry 0 (ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0) – Offset 40E00004h

MMIO BASE VALUE for entry 0.

Type	Size	Offset	Default
MMIO	32 bit	40E00004h	80001000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	80001h RW	<b>MMIO_LIMIT_VALUE:</b> MMIO Limit VALUE for entry K: This defines the MMIO Limit (4K aligned address offset) value.
11:0	0h RO	<b>Reserved</b>

### 14.13.1.3 OCP Translate Offset For Entry 0 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0) — Offset 40E00008h

OCP Translate Offset for entry 0.

Type	Size	Offset	Default
MMIO	32 bit	40E00008h	40400000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	40400h RW	<b>OCP_XLATE_OFFSET:</b> OCP Translate Offset for entry K: This defines the OCP translate offset to be substituted instead of the incoming MMIO address to derive the upper OCP target address. The number of bits for offset and pass-through is defined in mask field.
11:0	0h RO	<b>Reserved</b>

### 14.13.1.4 OCP Translate Mask For Entry 0 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0) — Offset 40E0000Ch

OCP Translate Mask for entry 0.

Type	Size	Offset	Default
MMIO	32 bit	40E0000Ch	FFFF0000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	FFFF0h RW	<b>OCP_XLATE_MASK:</b> OCP Translate Mask for entry K: This defines the OCP translate mask bits for the incoming MMIO address to pass through onto OCP fabric. 0 : MMIO Address Pass through to OCP Fabric 1 : MMIO Address substituted by Translate Offset field.
11:0	0h RO	<b>Reserved</b>

#### **14.13.1.5 MMIO BASE VALUE For Entry 1 (ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_1) – Offset 40E00010h**

MMIO BASE VALUE for entry 1.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

#### **14.13.1.6 MMIO BASE VALUE For Entry 1 (ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_1) – Offset 40E00014h**

MMIO BASE VALUE for entry 1.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

#### **14.13.1.7 OCP Translate Offset For Entry 1 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_1) – Offset 40E00018h**

OCP Translate Offset for entry 1.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

#### **14.13.1.8 OCP Translate Mask For Entry 1 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_1) – Offset 40E0001Ch**

OCP Translate Mask for entry 1.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

#### **14.13.1.9 MMIO BASE VALUE For Entry 2 (ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_2) – Offset 40E00020h**

MMIO BASE VALUE for entry 2.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

#### **14.13.1.10 MMIO BASE VALUE For Entry 2 (ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_2) – Offset 40E00024h**

MMIO BASE VALUE for entry 2.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

**14.13.1.11 OCP Translate Offset For Entry 2  
(ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_2) — Offset 40E00028h**

OCP Translate Offset for entry 2.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

**14.13.1.12 OCP Translate Mask For Entry 2  
(ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_2) — Offset 40E0002Ch**

OCP Translate Mask for entry 2.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

**14.13.1.13 MMIO BASE VALUE For Entry 3  
(ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_3) — Offset 40E00030h**

MMIO BASE VALUE for entry 3.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

**14.13.1.14 MMIO BASE VALUE For Entry 3  
(ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_3) — Offset 40E00034h**

MMIO BASE VALUE for entry 3.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

**14.13.1.15 OCP Translate Offset For Entry 3  
(ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_3) — Offset 40E00038h**

OCP Translate Offset for entry 3.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

**14.13.1.16 OCP Translate Mask For Entry 3  
(ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_3) — Offset 40E0003Ch**

OCP Translate Mask for entry 3.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

**14.13.1.17 MMIO BASE VALUE For Entry 4  
(ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_4) – Offset 40E00040h**

MMIO BASE VALUE for entry 4.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

**14.13.1.18 MMIO BASE VALUE For Entry 4  
(ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_4) – Offset 40E00044h**

MMIO BASE VALUE for entry 4.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

**14.13.1.19 OCP Translate Offset For Entry 4  
(ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_4) – Offset 40E00048h**

OCP Translate Offset for entry 4.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

**14.13.1.20 OCP Translate Mask For Entry 4  
(ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_4) – Offset 40E0004Ch**

OCP Translate Mask for entry 4.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

**14.13.1.21 MMIO BASE VALUE For Entry 5  
(ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_5) – Offset 40E00050h**

MMIO BASE VALUE for entry 5.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

**14.13.1.22 MMIO BASE VALUE For Entry 5  
(ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_5) – Offset 40E00054h**

MMIO BASE VALUE for entry 5.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

#### **14.13.1.23 OCP Translate Offset For Entry 5 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_5) — Offset 40E00058h**

OCP Translate Offset for entry 5.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

#### **14.13.1.24 OCP Translate Mask For Entry 5 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_5) — Offset 40E0005Ch**

OCP Translate Mask for entry 5.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

#### **14.13.1.25 MMIO BASE VALUE For Entry 6 (ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_6) — Offset 40E00060h**

MMIO BASE VALUE for entry 6.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

#### **14.13.1.26 MMIO BASE VALUE For Entry 6 (ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_6) — Offset 40E00064h**

MMIO BASE VALUE for entry 6.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

#### **14.13.1.27 OCP Translate Offset For Entry 6 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_6) — Offset 40E00068h**

OCP Translate Offset for entry 6.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

#### **14.13.1.28 OCP Translate Mask For Entry 6 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_6) — Offset 40E0006Ch**

OCP Translate Mask for entry 6.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

#### **14.13.1.29 MMIO BASE VALUE For Entry 7 (ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_7) – Offset 40E00070h**

MMIO BASE VALUE for entry 7.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

#### **14.13.1.30 MMIO BASE VALUE For Entry 7 (ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_7) – Offset 40E00074h**

MMIO BASE VALUE for entry 7.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

#### **14.13.1.31 OCP Translate Offset For Entry 7 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_7) – Offset 40E00078h**

OCP Translate Offset for entry 7.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

#### **14.13.1.32 OCP Translate Mask For Entry 7 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_7) – Offset 40E0007Ch**

OCP Translate Mask for entry 7.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

#### **14.13.1.33 MMIO BASE VALUE For Entry 8 (ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_8) – Offset 40E00080h**

MMIO BASE VALUE for entry 8.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

#### **14.13.1.34 MMIO BASE VALUE For Entry 8 (ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_8) – Offset 40E00084h**

MMIO BASE VALUE for entry 8.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

#### **14.13.1.35 OCP Translate Offset For Entry 8 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_8) — Offset 40E00088h**

OCP Translate Offset for entry 8.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

#### **14.13.1.36 OCP Translate Mask For Entry 8 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_8) — Offset 40E0008Ch**

OCP Translate Mask for entry 8.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

#### **14.13.1.37 MMIO BASE VALUE For Entry 9 (ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_9) — Offset 40E00090h**

MMIO BASE VALUE for entry 9.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

#### **14.13.1.38 MMIO BASE VALUE For Entry 9 (ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_9) — Offset 40E00094h**

MMIO BASE VALUE for entry 9.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

#### **14.13.1.39 OCP Translate Offset For Entry 9 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_9) — Offset 40E00098h**

OCP Translate Offset for entry 9.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

#### **14.13.1.40 OCP Translate Mask For Entry 9 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_9) — Offset 40E0009Ch**

OCP Translate Mask for entry 9.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

#### **14.13.1.125MMIO BASE VALUE For Entry 31 (ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_31) – Offset 40E001F0h**

MMIO BASE VALUE for entry 31.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_BASE\_REG\_ENTRY\_0, offset 40E00000h.

#### **14.13.1.126MMIO BASE VALUE For Entry 31 (ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_31) – Offset 40E001F4h**

MMIO BASE VALUE for entry 31.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_MMIO\_LIMIT\_REG\_ENTRY\_0, offset 40E00004h.

#### **14.13.1.127OCP Translate Offset For Entry 31 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_31) – Offset 40E001F8h**

OCP Translate Offset for entry 31.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_OFFSET\_REG\_ENTRY\_0, offset 40E00008h.

#### **14.13.1.128OCP Translate Mask For Entry 31 (ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_31) – Offset 40E001FCh**

OCP Translate Mask for entry 31.

**Note:** Bit definitions are the same as ISH\_DS\_OCP\_ATT\_OCP\_XLATE\_MASK\_REG\_ENTRY\_0, offset 40E0000Ch.

## 14.14 Dashboard

Dashboard Registers	Address Offset	Table
Dashboard	40F00030h - 40F0103Ch	Table 13-24

## 14.14.1 Dashboard Registers Summary

Table 14-24. Summary of Dashboard Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
40F00030h	4	Reg VERF_ERR_STS_REG (VERF_ERR_STS_REG)	00000000h
40F00040h	4	Reg VERF_ADDR_REG1_0 (VERF_ADDR_REG1_0)	00000000h
40F00044h	4	Reg VERF_ADDR_REG1_1 (VERF_ADDR_REG1_1)	00000000h
40F00048h	4	Reg VERF_SIZE_REG1_0 (VERF_SIZE_REG1_0)	00000000h
40F0004Ch	4	Reg VERF_SIZE_REG1_1 (VERF_SIZE_REG1_1)	00000000h
40F00050h	4	Reg VERF_ADDR_REG2_0 (VERF_ADDR_REG2_0)	00000000h
40F00054h	4	Reg VERF_ADDR_REG2_1 (VERF_ADDR_REG2_1)	00000000h
40F00058h	4	Reg VERF_SIZE_REG2_0 (VERF_SIZE_REG2_0)	00000000h
40F0005Ch	4	Reg VERF_SIZE_REG2_1 (VERF_SIZE_REG2_1)	00000000h
40F00080h	4	Reg IMR_INFO_ADDR_REG1_0 (IMR_INFO_ADDR_REG1_0)	00000000h
40F00084h	4	Reg IMR_INFO_ADDR_REG1_1 (IMR_INFO_ADDR_REG1_1)	00000000h
40F00088h	4	Reg IMR_INFO_SIZE_REG1_0 (IMR_INFO_SIZE_REG1_0)	00000006h
40F0008Ch	4	Reg IMR_INFO_SIZE_REG1_1 (IMR_INFO_SIZE_REG1_1)	00000000h
40F00140h	4	Reg IP_GP_REG3_0 (IP_GP_REG3_0)	00000000h
40F00144h	4	Reg IP_GP_REG3_1 (IP_GP_REG3_1)	00000000h
40F00148h	4	Reg IP_GP_REG3_2 (IP_GP_REG3_2)	00000000h
40F0014Ch	4	Reg IP_GP_REG3_3 (IP_GP_REG3_3)	00000000h
40F00150h	4	Reg IP_GP_REG3_4 (IP_GP_REG3_4)	00000000h
40F00154h	4	Reg IP_GP_REG3_5 (IP_GP_REG3_5)	00000000h
40F00158h	4	Reg IP_GP_REG3_6 (IP_GP_REG3_6)	00000000h
40F0015Ch	4	Reg IP_GP_REG3_7 (IP_GP_REG3_7)	00000000h
40F00160h	4	Reg IP_GP_REG4_0 (IP_GP_REG4_0)	00000000h
40F00164h	4	Reg IP_GP_REG4_1 (IP_GP_REG4_1)	00000000h
40F00168h	4	Reg IP_GP_REG4_2 (IP_GP_REG4_2)	00000000h
40F0016Ch	4	Reg IP_GP_REG4_3 (IP_GP_REG4_3)	00000000h
40F00170h	4	Reg IP_GP_REG4_4 (IP_GP_REG4_4)	00000000h
40F00174h	4	Reg IP_GP_REG4_5 (IP_GP_REG4_5)	00000000h
40F00178h	4	Reg IP_GP_REG4_6 (IP_GP_REG4_6)	00000000h
40F0017Ch	4	Reg IP_GP_REG4_7 (IP_GP_REG4_7)	00000000h
40F01038h	4	Reg INT_MASK_REG (INT_MASK_REG)	00000000h
40F0103Ch	4	Reg INT_STS_REG (INT_STS_REG)	00000000h

### 14.14.1.1 Reg VERF\_ERR\_STS\_REG (VERF\_ERR\_STS\_REG) – Offset 40F00030h

Verf\_err\_sts\_reg.

Type	Size	Offset	Default
MMIO	32 bit	40F00030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:12	0h RW	<b>FW_PUSH_BITS:</b> Firmware push completed: Optional bits one for each of the four FW instances. These bits should be set by the IP or the verifier when the FW load process is complete. These bits should be connected to an Interrupt to either the IP, or the verifier based on the IP's FW load model. If the IP supports a push model, this bit should interrupt the IP indicating push is complete. If the IP supports a pull model, these bits could interrupt the verifier indicating pull is complete.
11:8	0h RO	<b>Reserved</b>
7:4	0h RW	<b>VERF_ERR_CODE:</b> Verifying error code: 4 bits that could be used to exchange generic error codes. This error must correspond to the failure bit set in bits 3:0.
3:0	0h RW	<b>VERF_FAIL_BITS:</b> Verifying failed: Verifier is expected to set this bit on any failure. There are 4 bits allocated for each of the 4 images that could be loaded. IP's could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP's controller.

#### 14.14.1.2 Reg VERF\_ADDR\_REG1\_0 (VERF\_ADDR\_REG1\_0) — Offset 40F00040h

Verf\_addr\_reg1.

Type	Size	Offset	Default
MMIO	32 bit	40F00040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	<b>VERF_ADDR_REG_1_0:</b> Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. Please refer to the Security rules in section 2.1.6 that need to be met for this region. This address is expected to be used by the IP to fetch the verified image into its local RAM s or to execute from. This register is updated by the verifier once it has finished verifying the IP's firmware image blobs into a physical address in the SOC's memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

#### 14.14.1.3 Reg VERF\_ADDR\_REG1\_1 (VERF\_ADDR\_REG1\_1) – Offset 40F00044h

Verf\_addr\_reg1.

Type	Size	Offset	Default
MMIO	32 bit	40F00044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	<b>VERF_ADDR_REG_1_1:</b> Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. Please refer to the Security rules in section 2.1.6 that need to be met for this region. This address is expected to be used by the IP to fetch the verified image into its local RAM s or to execute from. This register is updated by the verifier once it has finished verifying the IP's firmware image blobs into a physical address in the SOC's memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

#### 14.14.1.4 Reg VERF\_SIZE\_REG1\_0 (VERF\_SIZE\_REG1\_0) – Offset 40F00048h

Verf\_size\_reg1.

Type	Size	Offset	Default
MMIO	32 bit	40F00048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	<b>Reserved</b>
16	0h RW/O	<b>DONE_PUSH_PULL_V1:</b> Firmware push or pull completed: Optional bits one for each of the four FW instances. These bits should be set by the IP or the verifier when the FW load process is complete. These bits should be connected to an Interrupt to either the IP, or the verifier based on the IP's FW load model. If the IP supports a push model, this bit should interrupt the IP indicating push is complete. If the IP supports a pull model, these bits could interrupt the verifier indicating pull is complete.
15:4	0h RO	<b>Reserved</b>
3:1	0h RW/O	<b>IOSF_ROOT_SPACE_V1:</b> Optional field indicating the IOSF Root Space to be used by IP to accessing the verifier address range. This is optional information that could be provided by low level firmware components like BIOS or other SOC agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP's should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	<b>INTR_V1:</b> Verification Done: When this bit is set, Verifier will inform the IP (or equivalent HW logic or FW component) that the firmware corresponding to this dashboard register has successfully verified and resides at the physical memory address in bits 63:3. This bit along with the bits in the verifying error status register provide the status of the loading if verifying was triggered but not completed. IP's could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP's controller.

#### 14.14.1.5 Reg VERF\_SIZE\_REG1\_1 (VERF\_SIZE\_REG1\_1) – Offset 40F0004Ch

Verf\_size\_reg1.

Type	Size	Offset	Default
MMIO	32 bit	40F0004Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	<b>VERF_SIZE_REG_1_0:</b> Size of the image verified by the verifier in KB s. Please note that this could only be the first block being verified. The IP could choose to use this first block of 4KB to pass on additional information on the firmware like if it's not in contiguous memory, the address for the next block and the RS information to access it.

#### 14.14.1.6 Reg VERF\_ADDR\_REG2\_0 (VERF\_ADDR\_REG2\_0) – Offset 40F00050h

Verf\_addr\_reg2.

Type	Size	Offset	Default
MMIO	32 bit	40F00050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	<b>VERF_ADDR_REG_2_0:</b> Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. Please refer to the Security rules in section 2.1.6 that need to be met for this region. This address is expected to be used by the IP to fetch the verified image into its local RAM?S or to execute from. This register is updated by the verifier once it has finished verifying the IP?S firmware image blobs into a physical address in the SOC?S memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

#### 14.14.1.7 Reg VERF\_ADDR\_REG2\_1 (VERF\_ADDR\_REG2\_1) – Offset 40F00054h

Verf\_addr\_reg2.

Type	Size	Offset	Default
MMIO	32 bit	40F00054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	<b>VERF_ADDR_REG_2_1:</b> Physical address of the image after the verifier has integrity verified the image. This region should point to an integrity protected region only accessible to the verifier and the IP. Please refer to the Security rules in section 2.1.6 that need to be met for this region. This address is expected to be used by the IP to fetch the verified image into its local RAM?S or to execute from. This register is updated by the verifier once it has finished verifying the IP?S firmware image blobs into a physical address in the SOC?S memory map. These bits should be set before the verifying done bit is set. The address is aligned to a single dword.

#### 14.14.1.8 Reg VERF\_SIZE\_REG2\_0 (VERF\_SIZE\_REG2\_0) – Offset 40F00058h

Verf\_size\_reg2.

Type	Size	Offset	Default
MMIO	32 bit	40F00058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	<b>Reserved</b>
16	0h RW/O	<b>DONE_PUSH_PULL_V2:</b> Firmware push or pull completed: Optional bits one for each of the four FW instances. These bits should be set by the IP or the verifier when the FW load process is complete. These bits should be connected to an Interrupt to either the IP, or the verifier based on the IP?S FW load model. If the IP supports a push model, this bit should interrupt the IP indicating push is complete. If the IP supports a pull model, these bits could interrupt the verifier indicating pull is complete.

Bit Range	Default & Access	Field Name (ID): Description
15:4	0h RO	<b>Reserved</b>
3:1	0h RW/O	<b>IOSF_ROOT_SPACE_V2:</b> Optional field indicating the IOSF Root Space to be used by IP to accessing the verifier address range. This is optional information that could be provided by low level firmware components like BIOS or other SOC agents to inform the IP if the physical address being loaded is not in System memory or an IMR region of system memory that is stolen from the OS. IP's should default to use RS0 and use this field only in special cases when they expect to not use OS addressable memory or a memory region accessible by a peer to peer path in the fabrics.
0	0h RW/O	<b>INTR_V2:</b> Verification Done: When this bit is set, Verifier will inform the IP (or equivalent HW logic or FW component) that the firmware corresponding to this dashboard register has successfully verified and resides at the physical memory address in bits 63:3. This bit along with the bits in the verifying error status register provide the status of the loading if verifying was triggered but not completed. IP's could further optimize the usage of this bit by connecting it to an interrupt towards the host or the IP's controller.

#### 14.14.1.9 Reg VERF\_SIZE\_REG2\_1 (VERF\_SIZE\_REG2\_1) – Offset 40F0005Ch

Verf\_size\_reg2.

Type	Size	Offset	Default
MMIO	32 bit	40F0005Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/O	<b>VERF_SIZE_REG_2_0:</b> Size of the image verified by the verifier in KB's. Please note that this could only be the first block being verified. The IP could chose to use this first block of 4KB to pass on additional information on the firmware like if its not in contiguous memory, the address for the next block and the RS information to access it.

#### 14.14.1.10 Reg IMR\_INFO\_ADDR\_REG1\_0 (IMR\_INFO\_ADDR\_REG1\_0) – Offset 40F00080h

Imr\_info\_addr\_reg1.

Type	Size	Offset	Default
MMIO	32 bit	40F00080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IMR_INFO_ADDR_REG_1_0:</b> Physical base address of the IMR memory region allocated by the verifier to the IP.

#### 14.14.1.11 Reg IMR\_INFO\_ADDR\_REG1\_1 (IMR\_INFO\_ADDR\_REG1\_1) – Offset 40F00084h

Imr\_info\_addr\_reg1.

Type	Size	Offset	Default
MMIO	32 bit	40F00084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IMR_INFO_ADDR_REG_1_1:</b> Physical base address of the IMR memory region allocated by the verifier to the IP.

#### 14.14.1.12 Reg IMR\_INFO\_SIZE\_REG1\_0 (IMR\_INFO\_SIZE\_REG1\_0) – Offset 40F00088h

Imr\_info\_size\_reg1.

Type	Size	Offset	Default
MMIO	32 bit	40F00088h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000000h RW	<b>REG1_IMR_SIZE1:</b> Size of the IMR range in KB if the IMR is used and indicated by the address register.
3:1	3h RW	<b>REG1_ROOT_SPACE:</b> Optional bits indicating the Root Space to be used by the IP for accessing this address range. This is expected to be used in future if an SOC does not use RS3 to access IMR regions.
0	0h RW	<b>REG1_ALLOC_STS:</b> IMR Used: Bits used to indicate that an IMR is allocated by the SOC and the IP should use the values in this register and the size register for its address and size.

#### 14.14.1.13 Reg IMR\_INFO\_SIZE\_REG1\_1 (IMR\_INFO\_SIZE\_REG1\_1) – Offset 40F0008Ch

Imr\_info\_size\_reg1.

Type	Size	Offset	Default
MMIO	32 bit	40F0008Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>REG1_IMR_SIZE0:</b> Size of the IMR range in KB if the IMR is used and indicated by the address register.

#### 14.14.1.14 Reg IP\_GP\_REG3\_0 (IP\_GP\_REG3\_0) – Offset 40F00140h

Ip\_gpreg3.

Type	Size	Offset	Default
MMIO	32 bit	40F00140h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_3_0:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.15 Reg IP\_GP\_REG3\_1 (IP\_GP\_REG3\_1) – Offset 40F00144h

Ip\_gpreg3.

Type	Size	Offset	Default
MMIO	32 bit	40F00144h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_3_1:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.16 Reg IP\_GP\_REG3\_2 (IP\_GP\_REG3\_2) – Offset 40F00148h

Ip\_gpreg3.

Type	Size	Offset	Default
MMIO	32 bit	40F00148h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_3_2:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.17 Reg IP\_GP\_REG3\_3 (IP\_GP\_REG3\_3) – Offset 40F0014Ch

Ip\_gpreg3.

Type	Size	Offset	Default
MMIO	32 bit	40F0014Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_3_3:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.18 Reg IP\_GP\_REG3\_4 (IP\_GP\_REG3\_4) – Offset 40F00150h

Ip\_gpreg3.

Type	Size	Offset	Default
MMIO	32 bit	40F00150h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_3_4:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.19 Reg IP\_GP\_REG3\_5 (IP\_GP\_REG3\_5) – Offset 40F00154h

Ip\_gpreg3.

Type	Size	Offset	Default
MMIO	32 bit	40F00154h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_3_5:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.20 Reg IP\_GP\_REG3\_6 (IP\_GP\_REG3\_6) – Offset 40F00158h

Ip\_gpreg3.

Type	Size	Offset	Default
MMIO	32 bit	40F00158h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_3_6:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.21 Reg IP\_GP\_REG3\_7 (IP\_GP\_REG3\_7) – Offset 40F0015Ch

Ip\_gpreg3.

Type	Size	Offset	Default
MMIO	32 bit	40F0015Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_3_7:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.22 Reg IP\_GP\_REG4\_0 (IP\_GP\_REG4\_0) – Offset 40F00160h

Ip\_gpreg4.

Type	Size	Offset	Default
MMIO	32 bit	40F00160h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_4_0:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.23 Reg IP\_GP\_REG4\_1 (IP\_GP\_REG4\_1) – Offset 40F00164h

Ip\_gpreg4.

Type	Size	Offset	Default
MMIO	32 bit	40F00164h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_4_1:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.24 Reg IP\_GP\_REG4\_2 (IP\_GP\_REG4\_2) – Offset 40F00168h

Ip\_gpreg4.

Type	Size	Offset	Default
MMIO	32 bit	40F00168h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_4_2:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.25 Reg IP\_GP\_REG4\_3 (IP\_GP\_REG4\_3) – Offset 40F0016Ch

Ip\_gpreg4.

Type	Size	Offset	Default
MMIO	32 bit	40F0016Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_4_3:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.26 Reg IP\_GP\_REG4\_4 (IP\_GP\_REG4\_4) – Offset 40F00170h

Ip\_gpreg4.

Type	Size	Offset	Default
MMIO	32 bit	40F00170h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_4_4:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.27 Reg IP\_GP\_REG4\_5 (IP\_GP\_REG4\_5) – Offset 40F00174h

Ip\_gpreg4.

Type	Size	Offset	Default
MMIO	32 bit	40F00174h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_4_5:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.28 Reg IP\_GP\_REG4\_6 (IP\_GP\_REG4\_6) – Offset 40F00178h

Ip\_gpreg4.

Type	Size	Offset	Default
MMIO	32 bit	40F00178h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_4_6:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.29 Reg IP\_GP\_REG4\_7 (IP\_GP\_REG4\_7) – Offset 40F0017Ch

Ip\_gpreg4.

Type	Size	Offset	Default
MMIO	32 bit	40F0017Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>IP_GPR_4_7:</b> Optional general purpose registers for any customized information that needs to be exchanged with IP.

#### 14.14.1.30 Reg INT\_MASK\_REG (INT\_MASK\_REG) – Offset 40F01038h

Int\_mask\_reg.

Type	Size	Offset	Default
MMIO	32 bit	40F01038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20	0h RW	<b>IP_ACC_DENIED_MASK:</b> Access Denied mask reg.
19:16	0h RW	<b>IE_PUSH_PULL_DONE:</b> Interrupt enable bit for IP push or pull complete. One bit is allocated for each FW instance.By default all interrupts are masked at reset.
15:12	0h RW	<b>IE_VERF_DONE:</b> Interrupt enable bit for Verification done. One bit is allocated for each FW instance.By default all interrupts are masked at reset.
11:8	0h RW	<b>IE_VERIFIER_LOAD_DONE:</b> Interrupt enable bit for Verifier load complete bit. One bit is allocated for each FW instance.By default all interrupts are masked at reset.
7:4	0h RW	<b>IE_FW_LOAD_DONE:</b> Interrupt enable bit for FW loading done. One bit is allocated for each FW instance.By default all interrupts are masked at reset.
3:0	0h RW	<b>IE_IP_READY:</b> Interrupt enable bit for IP ready for FW load. One bit is allocated for each FW instance.By default all interrupts are masked at reset.

#### 14.14.1.31 Reg INT\_STS\_REG (INT\_STS\_REG) — Offset 40F0103Ch

Int\_sts\_reg.

Type	Size	Offset	Default
MMIO	32 bit	40F0103Ch	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20	0h RW/1C	<b>IP_ACC_DENIED_INTR:</b> Access denied intr reg.
19:16	0h RW/1C	<b>IE_PUSH_PULL_DONE_INTR:</b> Interrupt status bit for IP push or pull complete. One bit is allocated for each FW instance.This bit is expected to clear the interrupt to de-assert the interrupt line.
15:12	0h RW/1C	<b>IE_VERF_DONE_INTR:</b> Interrupt status bit for Verification done. One bit is allocated for each FW instance.This bit is expected to clear the interrupt to de-assert the interrupt line.
11:8	0h RW/1C	<b>IE_VERIFIER_LOAD_DONE_INTR:</b> Interrupt status bit for Verifier load complete bit. One bit is allocated for each FW instance.This bit is expected to clear the interrupt to de-assert the interrupt line.
7:4	0h RW/1C	<b>IE_FW_LOAD_DONE_INTR:</b> Interrupt status bit for FW loading done. One bit is allocated for each FW instance.This bit is expected to clear the interrupt to de-assert the interrupt line.
3:0	0h RW/1C	<b>IE_IP_READY_INTR:</b> Interrupt status bit for IP ready for FW load. One bit is allocated for each FW instance.This bit is expected to clear the interrupt to de-assert the interrupt line.

## 14.15 PLL Registers

PLL Registers	Address Offset	Table
PLL	41000000h - 4100007Ch	Table 13-25

## 14.15.1 PLL Registers Summary

Table 14-25. Summary of PLL Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
41000000h	4	Reg_LCPLL_DIV0 (LCPLL_DIV0)	4800004Eh
41000004h	4	Reg_LCPLL_CFG0 (LCPLL_CFG0)	00000000h
41000008h	4	Reg_LCPLL_SSC0 (LCPLL_SSC0)	00000139h
4100000Ch	4	Reg_LCPLL_CFG1 (LCPLL_CFG1)	00000000h
41000010h	4	Reg_LCPLL_LF0 (LCPLL_LF0)	0A010804h
41000014h	4	Reg_LCPLL_CFG2 (LCPLL_CFG2)	00000000h
41000018h	4	Reg_LCPLL_DIV1 (LCPLL_DIV1)	00020000h
4100001Ch	4	Reg_LCPLL_RCOMP (LCPLL_RCOMP)	002A0003h
41000020h	4	Reg_LCPLL_SSC1 (LCPLL_SSC1)	00000000h
41000024h	4	Reg_LCPLL_LF1 (LCPLL_LF1)	00000000h
41000028h	4	Reg_LCPLL_TDC0 (LCPLL_TDC0)	000F0011h
4100002Ch	4	Reg_LCPLL_LF2 (LCPLL_LF2)	0000030Ah
41000030h	4	Reg_LCPLL_DFT0 (LCPLL_DFT0)	78003C00h
41000034h	4	Reg_LCPLL_DFT1 (LCPLL_DFT1)	00000000h
41000038h	4	Reg_LCPLL_DFT2Reg (LCPLL_DFT2)	00000000h

### 14.15.1.1 Reg\_LCPLL\_DIV0 (LCPLL\_DIV0) – Offset 41000000h

RET.

Type	Size	Offset	Default
MMIO	32 bit	41000000h	4800004Eh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved</b>
30	1h RW	<b>I_FRACNEN_H:</b> RET Enables fractional modulator. For overclocking case, this bit need to be set to '1', even though it starts with integer division ratio .
29:24	08h RW	<b>I_FRACDIV_2:</b> RET Fractional Modulator settings Effected by i_fbdv_propagate_h.
23:16	00h RW	<b>I_FRACDIV_1:</b> RET Fractional Modulator settings Effected by i_fbdv_propagate_h.
15:8	00h RW	<b>I_FRACDIV_0:</b> RET Fractional Modulator settings Effected by i_fbdv_propagate_h.
7:0	4Eh RW	<b>I_FBDIVRATIO:</b> RET Feedback divider post division (M2) Effected by i_fbdv_propagate_h.

#### 14.15.1.2 Reg LCPLL\_CFG0 (LCPLL\_CFG0) — Offset 41000004h

RET.

Type	Size	Offset	Default
MMIO	32 bit	41000004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	<b>Reserved</b>
24	0h RW/1C	<b>I_OVC_SNAPSHOT_H:</b> RETCLR This bit enables for LCPLL to take snapshot of PLL calibration states and integral component.
23:9	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C	<b>I_FBDIV_PROPAGATE_H:</b> RETCLR Propagate bit for LCPLL to capture feedback divider ratio settings and feedfwrwd gain. This bit is automatically cleared after divratio ratio settings captured. (hw clear).
7:1	0h RO	<b>Reserved</b>
0	0h RW	<b>I_PLLRAMPEN_H:</b> RET This need to be asserted for dynamically updating AFC (coarse DCO code). In normal POR mode, AFC is not updated. For supporting over clocking through PLL and memACT (-1.6125%), this bit need to be asserted so that AFC can be dynamically updated.

#### 14.15.1.3 Reg LCPLL\_SSC0 (LCPLL\_SSC0) — Offset 41000008h

RET.

Type	Size	Offset	Default
MMIO	32 bit	41000008h	00000139h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	<b>Reserved</b>
25:24	0h RW	<b>I_SSCSTEPSIZE_1:</b> RET Fractional value for one SSC frequency step. effected by i_ssc_propagate_h.
23:16	00h RW	<b>I_SSCSTEPSIZE_0:</b> RET Fractional value for one SSC frequency step. effected by i_ssc_propagate_h.
15:11	0h RO	<b>Reserved</b>
10	0h RW	<b>I_SSCEN_H:</b> RET Enables SSC modulator. Used for dynamically controlling SSC modulator. SSC profile shuts off after reaching neutral point.
9	0h RW	<b>I_FEEDFWRDCAL_PAUSE_H:</b> RET This bit is for dynamically turning on and off feed forward gain calibration, when i_feedfwrdcal_en_h is enabled to take care of dynamic feedfwrdfgain calculation during SSC mode.
8	1h RW	<b>I_FEEDFWRDCAL_EN_H:</b> RET Background feedforward gain calibration enable signal This is meant for PVT coverage. During PLL ramping this need to be disabled. It is taken care by dynamically changing i_feedfwrdcal_pause_h.
7:0	39h RW	<b>I_FEEDFWRDGAIN:</b> RET Feedforwad gain for fractional mode/SSC mode PLL This setting is needed whenever PLL is configured in fractional mode or configured for SSC clock generation. Effected by i_fbdiv_propagate_h.

#### 14.15.1.4 Reg LCPLL\_CFG1 (LCPLL\_CFG1) — Offset 4100000Ch

RET.

Type	Size	Offset	Default
MMIO	32 bit	4100000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	<b>Reserved</b>
16	0h RW	<b>I_FRACDIV_TOGGLE:</b> RET Not used.
15:9	0h RO	<b>Reserved</b>
8	0h RW	<b>I_RAMPAFC_SSSEN_H:</b> RET 0: Disables changing of AFC during SSC 1; Enables AFC changes during SSC to take care PLL ramping and SSC simultaneously This need to be high only for 2-3% SSC spread cases. For BCLK PLL case, default is 1'b0 as 0.5% can be covered with out AFC changes.
7:1	0h RO	<b>Reserved</b>
0	0h RW/1C	<b>I_SSC_PROPAGATE_H:</b> RETCLR Propagate bit for LCPLL to capture SSC stepsize This bit is automatically cleared after sscstepsize settings captured. (hw clear).

#### 14.15.1.5 Reg LCPLL\_LFO (LCPLL\_LFO) — Offset 41000010h

RET.

Type	Size	Offset	Default
MMIO	32 bit	41000010h	0A010804h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved</b>
30:27	1h RW	<b>I_NDIVRATIO:</b> RET Refclk input divider control, which sets the divide ratio for the PLL input reference clock 0000 divide by 1 0001 divide by 1 (default) 0010 divide by 2 0011 divide by 3 0100 divide by 4 0101 divide by 5 0110 divide by 6 0111 divide by 7 1000 - 1111 reserved values, do not use.
26:24	2h RW	<b>I_FBPREDIVRATIO:</b> RET predivider ratio 000 : /1 (default) 001: reserved 010: /2 011: /2 + (i_fbddivratio + 0.5) 100: /4 101 - 111: reserved.
23:19	0h RO	<b>Reserved</b>

- SPI\_3 Registers

SPI Interface Registers	Address Offset	Table
SPI_0	48100000h - 481000FCh	Table 13-26
SPI_1	48102000h - 481020FCh	Table 13-27
SPI_2	48104000h - 481040FCh	Table 13-28
SPI_3	48106000h - 481060FCh	Table 13-29

## 14.16.1 SPI\_0 Registers Summary

Table 14-26. Summary of SPI\_0 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48100000h	4	CTRLR0	01000007h
48100004h	4	CTRLR1	00000000h
48100008h	4	SSIENR	00000000h
4810000Ch	4	MWCR	00000000h
48100010h	4	SER	00000000h
48100014h	4	BAUDR	00000000h
48100018h	4	TXFTLR	00000000h
4810001Ch	4	RXFTLR	00000000h
48100020h	4	TXFLR	00000000h
48100024h	4	RXFLR	00000000h
48100028h	4	SR	00000006h
4810002Ch	4	IMR	0000003Fh
48100030h	4	ISR	00000000h
48100034h	4	RISR	00000000h
48100038h	4	TXOICR	00000000h
4810003Ch	4	RXOICR	00000000h
48100040h	4	RXUICR	00000000h
48100044h	4	MSTICR	00000000h
48100048h	4	ICR	00000000h
4810004Ch	4	DMACR	00000000h
48100050h	4	DMATDLR	00000000h
48100054h	4	DMARDLR	00000000h
48100058h	4	IDR	FFFFFFFh
4810005Ch	4	SSI_VERSION_ID	3430322Ah
48100060h	4	DR0	00000000h
48100064h	4	DR1	00000000h
48100068h	4	DR2	00000000h
4810006Ch	4	DR3	00000000h
48100070h	4	DR4	00000000h
48100074h	4	DR5	00000000h
48100078h	4	DR6	00000000h
4810007Ch	4	DR7	00000000h
48100080h	4	DR8	00000000h
48100084h	4	DR9	00000000h
48100088h	4	DR10	00000000h
4810008Ch	4	DR11	00000000h
48100090h	4	DR12	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48100094h	4	DR13	00000000h
48100098h	4	DR14	00000000h
4810009Ch	4	DR15	00000000h
481000A0h	4	DR16	00000000h
481000A4h	4	DR17	00000000h
481000A8h	4	DR18	00000000h
481000ACh	4	DR19	00000000h
481000B0h	4	DR20	00000000h
481000B4h	4	DR21	00000000h
481000B8h	4	DR22	00000000h
481000BCh	4	DR23	00000000h
481000C0h	4	DR24	00000000h
481000C4h	4	DR25	00000000h
481000C8h	4	DR26	00000000h
481000CCh	4	DR27	00000000h
481000D0h	4	DR28	00000000h
481000D4h	4	DR29	00000000h
481000D8h	4	DR30	00000000h
481000DCh	4	DR31	00000000h
481000E0h	4	DR32	00000000h
481000E4h	4	DR33	00000000h
481000E8h	4	DR34	00000000h
481000ECh	4	DR35	00000000h
481000F0h	4	RX_SAMPLE_DLY	00000000h
481000FCh	4	RSVD	00000000h

#### 14.16.1.1 CTRLR0 – Offset 48100000h

Control Register 0 - This register controls the serial data transfer. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: SSI\_CTRLR0\_RST

Type	Size	Offset	Default
MMIO	32 bit	48100000h	01000007h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	<b>Reserved</b>
24	1h RW	<b>SSTE:</b> Slave Select Toggle Enable. When operating in SPI mode with clock phase (SCPH) set to 0, this register controls the behavior of the slave select line (ss_*_n) between data frames. If this register field is set to 1 the ss_*_n line will toggle between consecutive data frames, with the serial clock (sclk) being held to its default value while ss_*_n is high; if this register field is set to 0 the ss_*_n will stay low and sclk will run continuously for the duration of the transfer. Note: This register is only valid when SSI_SCPH0_SSTOOGLE is set to 1.
23	0h RO	<b>Reserved</b>
22:21	0h RO/V	<b>SPI_FRF:</b> SPI Frame Format: Selects data frame format for Transmitting/Receiving the data Bits only valid when SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode. When SSI_SPI_MODE is configured for "Dual Mode", 10/11 combination is reserved. When SSI_SPI_MODE is configured for "Quad Mode", 11 combination is reserved.
20:16	00h RO/V	<b>DFS_32:</b> Data Frame Size in 32-bit transfer size mode. Used to select the data frame size in 32-bit transfer mode. These bits are only valid when SSI_MAX_XFER_SIZE is configured to 32. When the data frame size is programmed to be less than 32 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You are responsible for making sure that transmit data is right-justified before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data. Note: When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 0x01, - DFS value should be multiple of 4 if SPI_FRF = 0x10, - DFS value should be multiple of 8 if SPI_FRF = 0x11.
15:12	0h RW	<b>CFS:</b> Control Frame Size. Selects the length of the control word for the Microwire frame format.
11	0h RW	<b>SRL:</b> Shift Register Loop. Used for testing purposes only. When internally active, connects the transmit shift register output to the receive shift register input. Can be used in both serial-slave and serial-master modes. When the DW_apb_ssi is configured as a slave in loopback mode, the ss_in_n and ssi_clk signals must be provided by an external source. In this mode, the slave cannot generate these signals because there is nothing to which to loop back
10	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RW	<b>TMOD:</b> Transfer Mode. Selects the mode of transfer for serial communication. This field does not affect the transfer duplicity. Only indicates whether the receive or transmit data are valid. In transmit-only mode, data received from the external device is not valid and is not stored in the receive FIFO memory; it is overwritten on the next transfer. In receive-only mode, transmitted data are not valid. After the first write to the transmit FIFO, the same word is retransmitted for the duration of the transfer. In transmit-and-receive mode, both transmit and receive data are valid. The transfer continues until the transmit FIFO is empty. Data received from the external device are stored into the receive FIFO memory, where it can be accessed by the host processor. In eeprom-read mode, receive data is not valid while control data is being transmitted. When all control data is sent to the EEPROM, receive data becomes valid and transmit data becomes invalid. All data in the transmit FIFO is considered control data in this mode. This transfer mode is only valid when the DW_apb_ssi is configured as master device. 00 - Transmit & Receive 01 - Transmit Only 10 - Receive Only 11 - EEPROM Read When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. There are only two valid combinations: 10 - Read 01 - Write
7	0h RW	<b>SCPOL:</b> Serial Clock Polarity. Valid when the frame format (FRF) is set to Motorola SPI. Used to select the polarity of the inactive serial clock, which is held inactive when the DW_apb_ssi master is not actively transferring data on the serial bus.
6	0h RW	<b>SCPH:</b> Serial Clock Phase. Valid when the frame format (FRF) is set to Motorola SPI. The serial clock phase selects the relationship of the serial clock with the slave select signal. When SCPH = 0, data are captured on the first edge of the serial clock. When SCPH = 1, the serial clock starts toggling one cycle after the slave select line is activated, and data are captured on the second edge of the serial clock.
5:4	0h RW	<b>FRF:</b> Frame Format. Selects which serial protocol transfers the data.
3:0	7h RW	<b>DFS:</b> Data Frame Size. This register field is only valid when SSI_MAX_XFER_SIZE is configured to 16. If SSI_MAX_XFER_SIZE is configured to 32, then writing to this field will not have any effect. Selects the data frame length. When the data frame size is programmed to be less than 16 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You must right-justify transmit data before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data Note: When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 01, - DFS value should be multiple of 4 if SPI_FRF = 10, - DFS value should be multiple of 8 if SPI_FRF = 11.

#### 14.16.1.2 CTRLR1 – Offset 48100004h

Control Register 1 - This register exists only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. Control register 1 controls the end of serial transfers when in receive-only mode. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>NDF:</b> Number of Data Frames. When TMOD = 10 or TMOD = 11 , this register field sets the number of data frames to be continuously received by the DW_apb_ssi. The DW_apb_ssi continues to receive serial data until the number of data frames received is equal to this register value plus 1, which enables you to receive up to 64 KB of data in a continuous transfer. When the DW_apb_ssi is configured as a serial slave, the transfer continues for as long as the slave is selected. Therefore, this register serves no purpose and is not present when the DW_apb_ssi is configured as a serial slave.

### 14.16.1.3 SSIENR — Offset 48100008h

SSI Enable Register - This register enables and disables the DW\_apb\_ssi. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>SSI_EN:</b> SSI Enable. Enables and disables all DW_apb_ssi operations. When disabled, all serial transfers are halted immediately. Transmit and receive FIFO buffers are cleared when the device is disabled. It is impossible to program some of the DW_apb_ssi control registers when enabled. When disabled, the ssi_sleep output is set (after delay) to inform the system that it is safe to remove the ssi_clk, thus saving power consumption in the system.

#### 14.16.1.4 MWCR — Offset 4810000Ch

Microwire Control Register - This register controls the direction of the data word for the half-duplex Microwire serial protocol. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2	0h RW	<b>MHS:</b> Microwire Handshaking. Relevant only when the DW_apb_ssi is configured as a serial-master device. When configured as a serial slave, this bit field has no functionality. Used to enable and disable the busy/ready handshaking interface for the Microwire protocol. When enabled, the DW_apb_ssi checks for a ready status from the target slave, after the transfer of the last data/control bit, before clearing the BUSY status in the SR register.
1	0h RW	<b>MDD:</b> Microwire Control. Defines the direction of the data word when the Microwire serial protocol is used. When this bit is set to 0, the data word is received by the DW_apb_ssi MacroCell from the external serial device. When this bit is set to 1, the data word is transmitted from the DW_apb_ssi MacroCell to the external serial device.
0	0h RW	<b>MWMOD:</b> Microwire Transfer Mode. Defines whether the Microwire transfer is sequential or non-sequential. When sequential mode is used, only one control word is needed to transmit or receive a block of data words. When non-sequential mode is used, there must be a control word for each data word that is transmitted or received.

#### 14.16.1.5 SER — Offset 48100010h

Slave Enable Register - This register is valid only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register enables the individual slave select output lines from the DW\_apb\_ssi master. Up to 16 slave-select output pins are available on the DW\_apb\_ssi master. Register bits can be set or cleared when SSI\_EN=0. If SSI\_EN=1, then register bits can be set (to delay the slave select assertion while TX FIFO is getting filled) but cannot be cleared. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>SER:</b> Slave Select Enable Flag. Each bit in this register corresponds to a slave select line (ss_x_n) from the DW_apb_ssi master. When a bit in this register is set (1), the corresponding slave select line from the master is activated when a serial transfer begins. It should be noted that setting or clearing bits in this register have no effect on the corresponding slave select outputs until a transfer is started. Before beginning a transfer, you should enable the bit in this register that corresponds to the slave device with which the master wants to communicate. When not operating in broadcast mode, only one bit in this field should be set.

#### 14.16.1.6 BAUDR — Offset 48100014h

Baud Rate Select - This register is valid only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register derives the frequency of the serial clock that regulates the data transfer. The 16-bit field in this register defines the ssi\_clk divider value. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>SCKDV:</b> SSI Clock Divider. The LSB for this field is always set to 0 and is unaffected by a write operation, which ensures an even value is held in this register. If the value is 0, the serial output clock (sclk_out) is disabled. The frequency of the sclk_out is derived from the following equation: Fsclk_out = Fssi_clk/SCKDV where SCKDV is any even value between 2 and 65534. For example: for Fssi_clk = 3.6864MHz and SCKDV = 2 Fsclk_out = 3.6864/2 = 1.8432MHz

### 14.16.1.7 TXFTLR — Offset 48100018h

Transmit FIFO Threshold Level - This register controls the threshold value for the transmit FIFO memory. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>TFT:</b> Transmit FIFO Threshold. Controls the level of entries (or below) at which the transmit FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256; this register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than or equal to the depth of the FIFO, this field is not written and retains its current value. When the number of transmit FIFO entries is less than or equal to this value, the transmit FIFO empty interrupt is triggered. For information on the Transmit FIFO Threshold values, see the "Master SPI and SSP Serial Transfers" in the DW_apb_ssi Databook. ssi_txe_intr is asserted when TFT or less data entries are present in transmit FIFO

### 14.16.1.8 RXFTLR — Offset 4810001Ch

Receive FIFO Threshold Level - This register controls the threshold value for the receive FIFO memory. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810001Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>RFT:</b> Receive FIFO Threshold. Controls the level of entries (or above) at which the receive FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256. This register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than the depth of the FIFO, this field is not written and retains its current value. When the number of receive FIFO entries is greater than or equal to this value + 1, the receive FIFO full interrupt is triggered. For information on the Receive FIFO Threshold values, see the "Master SPI and SSP Serial Transfers" in the DW_apb_ssi Databook. ssi_rxf_intr is asserted when RFT or more data entries are present in receive FIFO.

#### 14.16.1.9 TXFLR — Offset 48100020h

Transmit FIFO Level Register - This register contains the number of valid data entries in the transmit FIFO memory. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TXTFL:</b> Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

#### 14.16.1.10 RXFLR — Offset 48100024h

Receive FIFO Level Register - This register contains the number of valid data entries in the receive FIFO memory. This register can be ready at any time. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RXTFL:</b> Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

#### 14.16.1.11 SR – Offset 48100028h

Status Register - This is a read-only register used to indicate the current transfer status, FIFO status, and any transmission/reception errors that may have occurred. The status register may be read at any time. None of the bits in this register request an interrupt. Reset Value: 0x6

Type	Size	Offset	Default
MMIO	32 bit	48100028h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>DCOL:</b> Data Collision Error. Relevant only when the DW_apb_ssi is configured as a master device. This bit will be set if ss_in_n input is asserted by other master, when the DW_apb_ssi master is in the middle of the transfer. This informs the processor that the last data transfer was halted before completion. This bit is cleared when read.
5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. Set when the receive FIFO contains one or more entries and is cleared when the receive FIFO is empty. This bit can be polled by software to completely empty the receive FIFO.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. When the transmit FIFO is completely empty, this bit is set. When the transmit FIFO contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full.
0	0h RO/V	<b>BUSY:</b> SSI Busy Flag. When set, indicates that a serial transfer is in progress; when cleared indicates that the DW_apb_ssi is idle or disabled.

#### 14.16.1.12 IMR – Offset 4810002Ch

Interrupt Mask Register - This read/write register masks or enables all interrupts generated by the DW\_apb\_ssi. When the DW\_apb\_ssi is configured as a slave device, the MSTIM bit field is not present. This changes the reset value from 0x3F for serial-master configurations to 0x1F for serial-slave configurations. Reset Value: (SSI\_IS\_MASTER == 1) ? 0x3F : 0x1F

Type	Size	Offset	Default
MMIO	32 bit	4810002Ch	0000003Fh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	1h RW	<b>MSTIM:</b> Multi-Master Contention Interrupt Mask. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	1h RW	<b>RXFIM:</b> Receive FIFO Full Interrupt Mask
3	1h RW	<b>RXOIM:</b> Receive FIFO Overflow Interrupt Mask
2	1h RW	<b>RXUIM:</b> Receive FIFO Underflow Interrupt Mask
1	1h RW	<b>TXOIM:</b> Transmit FIFO Overflow Interrupt Mask
0	1h RW	<b>TXEIM:</b> Transmit FIFO Empty Interrupt Mask

#### 14.16.1.13 ISR – Offset 48100030h

Interrupt Status Register - This register reports the status of the DW\_apb\_ssi interrupts after they have been masked. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>MSTIS:</b> Multi-Master Contention Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	<b>RXFIS:</b> Receive FIFO Full Interrupt Status
3	0h RO/V	<b>RXOIS:</b> Receive FIFO Overflow Interrupt Status
2	0h RO/V	<b>RXUIS:</b> Receive FIFO Underflow Interrupt Status
1	0h RO/V	<b>TXOIS:</b> Transmit FIFO Overflow Interrupt Status
0	0h RO/V	<b>TXEIS:</b> Transmit FIFO Empty Interrupt Status

#### 14.16.1.14 RISR — Offset 48100034h

Raw Interrupt Status Register - This read-only register reports the status of the DW\_apb\_ssi interrupts prior to masking. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>MSTIR:</b> Multi-Master Contention Raw Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	<b>RXFIR:</b> Receive FIFO Full Raw Interrupt Status
3	0h RO/V	<b>RXOIR:</b> Receive FIFO Overflow Raw Interrupt Status
2	0h RO/V	<b>RXUIR:</b> Receive FIFO Underflow Raw Interrupt Status
1	0h RO/V	<b>TXOIR:</b> Transmit FIFO Overflow Raw Interrupt Status
0	0h RO/V	<b>TXEIR:</b> Transmit FIFO Empty Raw Interrupt Status

#### 14.16.1.15 TXOICR — Offset 48100038h

Transmit FIFO Overflow Interrupt Clear Register Register - Transmit FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TXOICR:</b> Clear Transmit FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_txo_intr interrupt; writing has no effect.

#### 14.16.1.16 RXOICR — Offset 4810003Ch

Receive FIFO Overflow Interrupt Clear Register - Receive FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810003Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>RXOICR:</b> Clear Receive FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxo_intr interrupt; writing has no effect.

#### 14.16.1.17 RXUICR — Offset 48100040h

Receive FIFO Underflow Interrupt Clear Register - Receive FIFO Underflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>RXUICR:</b> Clear Receive FIFO Underflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxu_intr interrupt; writing has no effect.

#### 14.16.1.18 MSTICR — Offset 48100044h

Multi-Master Interrupt Clear Register - Multi-Master Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>MSTICR:</b> Clear Multi-Master Contention Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_mst_intr interrupt; writing has no effect.

#### 14.16.1.19 ICR — Offset 48100048h

Interrupt Clear Register - Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>ICR:</b> Clear Interrupts. This register is set if any of the interrupts below are active. A read clears the ssi_txo_intr, ssi_rxu_intr, ssi_rxo_intr, and the ssi_mst_intr interrupts. Writing to this register has no effect.

#### 14.16.1.20 DMACR — Offset 4810004Ch

DMA Control Register - This register is only valid when DW\_apb\_ssi is configured with a set of DMA Controller interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to the register's address will have no effect; reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810004Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>TDMAE:</b> Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	<b>RDMAE:</b> Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel

#### 14.16.1.21 DMATDLR – Offset 48100050h

DMA Transmit Data Level - This register is only valid when the DW\_apb\_ssi is configured with a set of DMA interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>DMATDL:</b> Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1. For information on the DMATDL decode values, see the "Slave SPI and SSP Serial Transfers" section in the DW_apb_ssi Databook. dma_tx_req is asserted when DMATDL or less data entries are present in the transmit FIFO

### 14.16.1.22 DMARDLR – Offset 48100054h

DMA Receive Data Level - This register is only valid when DW\_apb\_ssi is configured with a set of DMA interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>DMARDL:</b> Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or above this field value + 1, and RDMAE=1. For information on the DMARDL decode values, see the "Slave SPI and SSP Serial Transfers" section in the DW_apb_ssi Databook. dma_rx_req is asserted when DMARDL or more valid data entries are present in the receive FIFO.

### 14.16.1.23 IDR – Offset 48100058h

Identification Register - This register contains the peripherals identification code, which is written into the register at configuration time using coreConsultant. Reset Value: SSI\_ID

Type	Size	Offset	Default
MMIO	32 bit	48100058h	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFh RO/V	<b>IDCODE:</b> Identification code. The register contains the peripheral's identification code, which is written into the register at configuration time using CoreConsultant.

#### 14.16.1.24 SSI\_VERSION\_ID – Offset 4810005Ch

coreKit version ID Register - This read-only register stores the specific DW\_apb\_ssi component version. Reset Value: SSI\_VERSION\_ID

Type	Size	Offset	Default
MMIO	32 bit	4810005Ch	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>SSI_COMP_VERSION:</b> Contains the hex representation of the Synopsys component version. Consists of ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*.

#### 14.16.1.25 DR0 – Offset 48100060h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48100060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW/V	<b>DR:</b> Data Register. When writing to this register, you must right-justify the data. Read data are automatically right-justified. If SSI_MAX_XFER_SIZE configuration parameter is set to 32, all 32 bits are valid. Otherwise, only 16 bits ([15:0]) of the register are valid. Read = Receive FIFO buffer Write = Transmit FIFO buffer.

#### 14.16.1.26 DR1 – Offset 48100064h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.27 DR2 – Offset 48100068h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.28 DR3 – Offset 4810006Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.29 DR4 – Offset 48100070h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.30 DR5 – Offset 48100074h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.31 DR6 – Offset 48100078h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read,

data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.32 DR7 – Offset 4810007Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.33 DR8 – Offset 48100080h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.34 DR9 – Offset 48100084h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus

into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.35 DR10 – Offset 48100088h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.36 DR11 – Offset 4810008Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.37 DR12 – Offset 48100090h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.38 DR13 – Offset 48100094h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.39 DR14 – Offset 48100098h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.40 DR15 – Offset 4810009Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.41 DR16 – Offset 481000A0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read,

data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.42 DR17 – Offset 481000A4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.43 DR18 – Offset 481000A8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.44 DR19 – Offset 481000ACh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus

into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.45 DR20 – Offset 481000B0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.46 DR21 – Offset 481000B4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.47 DR22 – Offset 481000B8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.48 DR23 – Offset 481000BCh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.49 DR24 – Offset 481000C0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.50 DR25 – Offset 481000C4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.51 DR26 – Offset 481000C8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read,

data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.52 DR27 — Offset 481000CCh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.53 DR28 — Offset 481000D0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.54 DR29 — Offset 481000D4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus

into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.55 DR30 – Offset 481000D8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.56 DR31 – Offset 481000DCh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.57 DR32 – Offset 481000E0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.58 DR33 – Offset 481000E4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.59 DR34 – Offset 481000E8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.60 DR35 – Offset 481000ECh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48100060h.

#### 14.16.1.61 RX\_SAMPLE\_DLY – Offset 481000F0h

RX Sample Delay Register - This register is only valid when the DW\_apb\_ssi is configured with rxd sample delay logic (SSI\_HAS\_RX\_SAMPLE\_DELAY==1). When the DW\_apb\_ssi is not configured with rxd sample delay logic, this register will not exist and writing to its address location will have no effect; reading from its address will

return zero. This register control the number of ssi\_clk cycles that are delayed (from the default sample time) before the actual sample of the rxd input occurs. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	481000F0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RSD:</b> Rxd Sample Delay. This register is used to delay the sample of the rxd input port. Each value represents a single ssi_clk delay on the sample of rxd. Note: If this register is programmed with a value that exceeds the depth of the internal shift registers (SSI_RX_DLY_SR_DEPTH) zero delay will be applied to the rxd sample.

#### 14.16.2.1 CTRLR0 – Offset 48102000h

Control Register 0 - This register controls the serial data transfer. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: SSI\_CTRLR0\_RST

Type	Size	Offset	Default
MMIO	32 bit	48102000h	01000007h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	<b>Reserved</b>
24	1h RW	<b>SSTE:</b> Slave Select Toggle Enable. When operating in SPI mode with clock phase (SCPH) set to 0, this register controls the behavior of the slave select line (ss_*_n) between data frames. If this register field is set to 1 the ss_*_n line will toggle between consecutive data frames, with the serial clock (sclk) being held to its default value while ss_*_n is high; if this register field is set to 0 the ss_*_n will stay low and sclk will run continuously for the duration of the transfer. Note: This register is only valid when SSI_SCPH0_SSTOOGLE is set to 1.
23	0h RO	<b>Reserved</b>
22:21	0h RO/V	<b>SPI_FRF:</b> SPI Frame Format: Selects data frame format for Transmitting/Receiving the data Bits only valid when SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode. When SSI_SPI_MODE is configured for "Dual Mode", 10/11 combination is reserved. When SSI_SPI_MODE is configured for "Quad Mode", 11 combination is reserved.
20:16	00h RO/V	<b>DFS_32:</b> Data Frame Size in 32-bit transfer size mode. Used to select the data frame size in 32-bit transfer mode. These bits are only valid when SSI_MAX_XFER_SIZE is configured to 32. When the data frame size is programmed to be less than 32 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You are responsible for making sure that transmit data is right-justified before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data. Note: When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 0x01, - DFS value should be multiple of 4 if SPI_FRF = 0x10, - DFS value should be multiple of 8 if SPI_FRF = 0x11.
15:12	0h RW	<b>CFS:</b> Control Frame Size. Selects the length of the control word for the Microwire frame format.
11	0h RW	<b>SRL:</b> Shift Register Loop. Used for testing purposes only. When internally active, connects the transmit shift register output to the receive shift register input. Can be used in both serial-slave and serial-master modes. When the DW_apb_ssi is configured as a slave in loopback mode, the ss_in_n and ssi_clk signals must be provided by an external source. In this mode, the slave cannot generate these signals because there is nothing to which to loop back
10	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RW	<b>TMOD:</b> Transfer Mode. Selects the mode of transfer for serial communication. This field does not affect the transfer duplicity. Only indicates whether the receive or transmit data are valid. In transmit-only mode, data received from the external device is not valid and is not stored in the receive FIFO memory; it is overwritten on the next transfer. In receive-only mode, transmitted data are not valid. After the first write to the transmit FIFO, the same word is retransmitted for the duration of the transfer. In transmit-and-receive mode, both transmit and receive data are valid. The transfer continues until the transmit FIFO is empty. Data received from the external device are stored into the receive FIFO memory, where it can be accessed by the host processor. In eeprom-read mode, receive data is not valid while control data is being transmitted. When all control data is sent to the EEPROM, receive data becomes valid and transmit data becomes invalid. All data in the transmit FIFO is considered control data in this mode. This transfer mode is only valid when the DW_apb_ssi is configured as master device. 00 - Transmit & Receive 01 - Transmit Only 10 - Receive Only 11 - EEPROM Read When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. There are only two valid combinations: 10 - Read 01 - Write
7	0h RW	<b>SCPOL:</b> Serial Clock Polarity. Valid when the frame format (FRF) is set to Motorola SPI. Used to select the polarity of the inactive serial clock, which is held inactive when the DW_apb_ssi master is not actively transferring data on the serial bus.
6	0h RW	<b>SCPH:</b> Serial Clock Phase. Valid when the frame format (FRF) is set to Motorola SPI. The serial clock phase selects the relationship of the serial clock with the slave select signal. When SCPH = 0, data are captured on the first edge of the serial clock. When SCPH = 1, the serial clock starts toggling one cycle after the slave select line is activated, and data are captured on the second edge of the serial clock.
5:4	0h RW	<b>FRF:</b> Frame Format. Selects which serial protocol transfers the data.
3:0	7h RW	<b>DFS:</b> Data Frame Size. This register field is only valid when SSI_MAX_XFER_SIZE is configured to 16. If SSI_MAX_XFER_SIZE is configured to 32, then writing to this field will not have any effect. Selects the data frame length. When the data frame size is programmed to be less than 16 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You must right-justify transmit data before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data Note: When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 01, - DFS value should be multiple of 4 if SPI_FRF = 10, - DFS value should be multiple of 8 if SPI_FRF = 11.

#### 14.16.2.2 CTRLR1 – Offset 48102004h

Control Register 1 - This register exists only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. Control register 1 controls the end of serial transfers when in receive-only mode. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>NDF:</b> Number of Data Frames. When TMOD = 10 or TMOD = 11 , this register field sets the number of data frames to be continuously received by the DW_apb_ssi. The DW_apb_ssi continues to receive serial data until the number of data frames received is equal to this register value plus 1, which enables you to receive up to 64 KB of data in a continuous transfer. When the DW_apb_ssi is configured as a serial slave, the transfer continues for as long as the slave is selected. Therefore, this register serves no purpose and is not present when the DW_apb_ssi is configured as a serial slave.

### 14.16.2.3 SSIENR — Offset 48102008h

SSI Enable Register - This register enables and disables the DW\_apb\_ssi. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>SSI_EN:</b> SSI Enable. Enables and disables all DW_apb_ssi operations. When disabled, all serial transfers are halted immediately. Transmit and receive FIFO buffers are cleared when the device is disabled. It is impossible to program some of the DW_apb_ssi control registers when enabled. When disabled, the ssi_sleep output is set (after delay) to inform the system that it is safe to remove the ssi_clk, thus saving power consumption in the system.

#### 14.16.2.4 MWCR — Offset 4810200Ch

Microwire Control Register - This register controls the direction of the data word for the half-duplex Microwire serial protocol. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810200Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2	0h RW	<b>MHS:</b> Microwire Handshaking. Relevant only when the DW_apb_ssi is configured as a serial-master device. When configured as a serial slave, this bit field has no functionality. Used to enable and disable the busy/ready handshaking interface for the Microwire protocol. When enabled, the DW_apb_ssi checks for a ready status from the target slave, after the transfer of the last data/control bit, before clearing the BUSY status in the SR register.
1	0h RW	<b>MDD:</b> Microwire Control. Defines the direction of the data word when the Microwire serial protocol is used. When this bit is set to 0, the data word is received by the DW_apb_ssi MacroCell from the external serial device. When this bit is set to 1, the data word is transmitted from the DW_apb_ssi MacroCell to the external serial device.
0	0h RW	<b>MWMOD:</b> Microwire Transfer Mode. Defines whether the Microwire transfer is sequential or non-sequential. When sequential mode is used, only one control word is needed to transmit or receive a block of data words. When non-sequential mode is used, there must be a control word for each data word that is transmitted or received.

#### 14.16.2.5 SER — Offset 48102010h

Slave Enable Register - This register is valid only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register enables the individual slave select output lines from the DW\_apb\_ssi master. Up to 16 slave-select output pins are available on the DW\_apb\_ssi master. Register bits can be set or cleared when SSI\_EN=0. If SSI\_EN=1, then register bits can be set (to delay the slave select assertion while TX FIFO is getting filled) but cannot be cleared. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>SER:</b> Slave Select Enable Flag. Each bit in this register corresponds to a slave select line (ss_x_n) from the DW_apb_ssi master. When a bit in this register is set (1), the corresponding slave select line from the master is activated when a serial transfer begins. It should be noted that setting or clearing bits in this register have no effect on the corresponding slave select outputs until a transfer is started. Before beginning a transfer, you should enable the bit in this register that corresponds to the slave device with which the master wants to communicate. When not operating in broadcast mode, only one bit in this field should be set.

#### 14.16.2.6 BAUDR — Offset 48102014h

Baud Rate Select - This register is valid only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register derives the frequency of the serial clock that regulates the data transfer. The 16-bit field in this register defines the ssi\_clk divider value. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>SCKDV:</b> SSI Clock Divider. The LSB for this field is always set to 0 and is unaffected by a write operation, which ensures an even value is held in this register. If the value is 0, the serial output clock (sclk_out) is disabled. The frequency of the sclk_out is derived from the following equation: Fsclk_out = Fssi_clk/SCKDV where SCKDV is any even value between 2 and 65534. For example: for Fssi_clk = 3.6864MHz and SCKDV = 2 Fsclk_out = 3.6864/2 = 1.8432MHz

### 14.16.2.7 TXFTLR — Offset 48102018h

Transmit FIFO Threshold Level - This register controls the threshold value for the transmit FIFO memory. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>TFT:</b> Transmit FIFO Threshold. Controls the level of entries (or below) at which the transmit FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256; this register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than or equal to the depth of the FIFO, this field is not written and retains its current value. When the number of transmit FIFO entries is less than or equal to this value, the transmit FIFO empty interrupt is triggered. For information on the Transmit FIFO Threshold values, see the "Master SPI and SSP Serial Transfers" in the DW_apb_ssi Databook. ssi_txe_intr is asserted when TFT or less data entries are present in transmit FIFO

### 14.16.2.8 RXFTLR — Offset 4810201Ch

Receive FIFO Threshold Level - This register controls the threshold value for the receive FIFO memory. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810201Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>RFT:</b> Receive FIFO Threshold. Controls the level of entries (or above) at which the receive FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256. This register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than the depth of the FIFO, this field is not written and retains its current value. When the number of receive FIFO entries is greater than or equal to this value + 1, the receive FIFO full interrupt is triggered. For information on the Receive FIFO Threshold values, see the "Master SPI and SSP Serial Transfers" in the DW_apb_ssi Databook. ssi_rxf_intr is asserted when RFT or more data entries are present in receive FIFO.

#### 14.16.2.9 TXFLR — Offset 48102020h

Transmit FIFO Level Register - This register contains the number of valid data entries in the transmit FIFO memory. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TXTFL:</b> Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

#### 14.16.2.10 RXFLR — Offset 48102024h

Receive FIFO Level Register - This register contains the number of valid data entries in the receive FIFO memory. This register can be ready at any time. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RXTFL:</b> Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

#### 14.16.2.11 SR – Offset 48102028h

Status Register - This is a read-only register used to indicate the current transfer status, FIFO status, and any transmission/reception errors that may have occurred. The status register may be read at any time. None of the bits in this register request an interrupt. Reset Value: 0x6

Type	Size	Offset	Default
MMIO	32 bit	48102028h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>DCOL:</b> Data Collision Error. Relevant only when the DW_apb_ssi is configured as a master device. This bit will be set if ss_in_n input is asserted by other master, when the DW_apb_ssi master is in the middle of the transfer. This informs the processor that the last data transfer was halted before completion. This bit is cleared when read.
5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. Set when the receive FIFO contains one or more entries and is cleared when the receive FIFO is empty. This bit can be polled by software to completely empty the receive FIFO.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. When the transmit FIFO is completely empty, this bit is set. When the transmit FIFO contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full.
0	0h RO/V	<b>BUSY:</b> SSI Busy Flag. When set, indicates that a serial transfer is in progress; when cleared indicates that the DW_apb_ssi is idle or disabled.

#### 14.16.2.12 IMR – Offset 4810202Ch

Interrupt Mask Register - This read/write register masks or enables all interrupts generated by the DW\_apb\_ssi. When the DW\_apb\_ssi is configured as a slave device, the MSTIM bit field is not present. This changes the reset value from 0x3F for serial-master configurations to 0x1F for serial-slave configurations. Reset Value: (SSI\_IS\_MASTER == 1) ? 0x3F : 0x1F

Type	Size	Offset	Default
MMIO	32 bit	4810202Ch	0000003Fh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	1h RW	<b>MSTIM:</b> Multi-Master Contention Interrupt Mask. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	1h RW	<b>RXFIM:</b> Receive FIFO Full Interrupt Mask
3	1h RW	<b>RXOIM:</b> Receive FIFO Overflow Interrupt Mask
2	1h RW	<b>RXUIM:</b> Receive FIFO Underflow Interrupt Mask
1	1h RW	<b>TXOIM:</b> Transmit FIFO Overflow Interrupt Mask
0	1h RW	<b>TXEIM:</b> Transmit FIFO Empty Interrupt Mask

#### 14.16.2.13 ISR – Offset 48102030h

Interrupt Status Register - This register reports the status of the DW\_apb\_ssi interrupts after they have been masked. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>MSTIS:</b> Multi-Master Contention Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	<b>RXFIS:</b> Receive FIFO Full Interrupt Status
3	0h RO/V	<b>RXOIS:</b> Receive FIFO Overflow Interrupt Status
2	0h RO/V	<b>RXUIS:</b> Receive FIFO Underflow Interrupt Status
1	0h RO/V	<b>TXOIS:</b> Transmit FIFO Overflow Interrupt Status
0	0h RO/V	<b>TXEIS:</b> Transmit FIFO Empty Interrupt Status

#### 14.16.2.14 RISR — Offset 48102034h

Raw Interrupt Status Register - This read-only register reports the status of the DW\_apb\_ssi interrupts prior to masking. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>MSTIR:</b> Multi-Master Contention Raw Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	<b>RXFIR:</b> Receive FIFO Full Raw Interrupt Status
3	0h RO/V	<b>RXOIR:</b> Receive FIFO Overflow Raw Interrupt Status
2	0h RO/V	<b>RXUIR:</b> Receive FIFO Underflow Raw Interrupt Status
1	0h RO/V	<b>TXOIR:</b> Transmit FIFO Overflow Raw Interrupt Status
0	0h RO/V	<b>TXEIR:</b> Transmit FIFO Empty Raw Interrupt Status

#### 14.16.2.15 TXOICR — Offset 48102038h

Transmit FIFO Overflow Interrupt Clear Register Register - Transmit FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TXOICR:</b> Clear Transmit FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_txo_intr interrupt; writing has no effect.

#### 14.16.2.16 RXOICR — Offset 4810203Ch

Receive FIFO Overflow Interrupt Clear Register - Receive FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810203Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>RXOICR:</b> Clear Receive FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxo_intr interrupt; writing has no effect.

#### 14.16.2.17 RXUICR — Offset 48102040h

Receive FIFO Underflow Interrupt Clear Register - Receive FIFO Underflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>RXUICR:</b> Clear Receive FIFO Underflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxu_intr interrupt; writing has no effect.

#### 14.16.2.18 MSTICR — Offset 48102044h

Multi-Master Interrupt Clear Register - Multi-Master Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>MSTICR:</b> Clear Multi-Master Contention Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_mst_intr interrupt; writing has no effect.

#### 14.16.2.19 ICR — Offset 48102048h

Interrupt Clear Register - Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>ICR:</b> Clear Interrupts. This register is set if any of the interrupts below are active. A read clears the ssi_txo_intr, ssi_rxu_intr, ssi_rxo_intr, and the ssi_mst_intr interrupts. Writing to this register has no effect.

#### 14.16.2.20 DMACR — Offset 4810204Ch

DMA Control Register - This register is only valid when DW\_apb\_ssi is configured with a set of DMA Controller interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to the register's address will have no effect; reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810204Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>TDMAE:</b> Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	<b>RDMAE:</b> Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel

#### 14.16.2.21 DMATDLR – Offset 48102050h

DMA Transmit Data Level - This register is only valid when the DW\_apb\_ssi is configured with a set of DMA interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>DMATDL:</b> Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1. For information on the DMATDL decode values, see the "Slave SPI and SSP Serial Transfers" section in the DW_apb_ssi Databook. dma_tx_req is asserted when DMATDL or less data entries are present in the transmit FIFO

#### 14.16.2.22 DMARDLR – Offset 48102054h

DMA Receive Data Level - This register is only valid when DW\_apb\_ssi is configured with a set of DMA interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>DMARDL:</b> Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or above this field value + 1, and RDMAE=1. For information on the DMARDL decode values, see the "Slave SPI and SSP Serial Transfers" section in the DW_apb_ssi Databook. dma_rx_req is asserted when DMARDL or more valid data entries are present in the receive FIFO.

#### 14.16.2.23 IDR – Offset 48102058h

Identification Register - This register contains the peripherals identification code, which is written into the register at configuration time using coreConsultant. Reset Value: SSI\_ID

Type	Size	Offset	Default
MMIO	32 bit	48102058h	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFh RO/V	<b>IDCODE:</b> Identification code. The register contains the peripheral's identification code, which is written into the register at configuration time using CoreConsultant.

#### 14.16.2.24 SSI\_VERSION\_ID – Offset 4810205Ch

coreKit version ID Register - This read-only register stores the specific DW\_apb\_ssi component version. Reset Value: SSI\_VERSION\_ID

Type	Size	Offset	Default
MMIO	32 bit	4810205Ch	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>SSI_COMP_VERSION:</b> Contains the hex representation of the Synopsys component version. Consists of ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*.

#### 14.16.2.25 DR0 – Offset 48102060h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48102060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW/V	<b>DR:</b> Data Register. When writing to this register, you must right-justify the data. Read data are automatically right-justified. If SSI_MAX_XFER_SIZE configuration parameter is set to 32, all 32 bits are valid. Otherwise, only 16 bits ([15:0]) of the register are valid. Read = Receive FIFO buffer Write = Transmit FIFO buffer.

#### 14.16.2.26 DR1 – Offset 48102064h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.27 DR2 – Offset 48102068h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.28 DR3 – Offset 4810206Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.29 DR4 – Offset 48102070h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.30 DR5 – Offset 48102074h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.31 DR6 – Offset 48102078h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read,

data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.32 DR7 – Offset 4810207Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.33 DR8 – Offset 48102080h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.34 DR9 – Offset 48102084h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus

into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.35 DR10 – Offset 48102088h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.36 DR11 – Offset 4810208Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.37 DR12 – Offset 48102090h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.40 DR15 – Offset 4810209Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.41 DR16 – Offset 481020A0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read,

data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.42 DR17 – Offset 481020A4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.43 DR18 – Offset 481020A8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.44 DR19 – Offset 481020ACh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus

into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.45 DR20 — Offset 481020B0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.46 DR21 — Offset 481020B4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.47 DR22 — Offset 481020B8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.48 DR23 – Offset 481020BCh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.49 DR24 – Offset 481020C0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.50 DR25 – Offset 481020C4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.51 DR26 – Offset 481020C8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read,

data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.52 DR27 – Offset 481020CCh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.53 DR28 – Offset 481020D0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.54 DR29 – Offset 481020D4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus

into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.55 DR30 – Offset 481020D8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.56 DR31 – Offset 481020DCh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.57 DR32 – Offset 481020E0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.58 DR33 – Offset 481020E4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pldata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.59 DR34 – Offset 481020E8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pldata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.60 DR35 – Offset 481020ECh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pldata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48102060h.

#### 14.16.2.61 RX\_SAMPLE\_DLY – Offset 481020F0h

RX Sample Delay Register - This register is only valid when the DW\_apb\_ssi is configured with rxd sample delay logic (SSI\_HAS\_RX\_SAMPLE\_DELAY==1). When the DW\_apb\_ssi is not configured with rxd sample delay logic, this register will not exist and writing to its address location will have no effect; reading from its address will

return zero. This register control the number of ssi\_clk cycles that are delayed (from the default sample time) before the actual sample of the rxd input occurs. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	481020F0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RSD:</b> Rxd Sample Delay. This register is used to delay the sample of the rxd input port. Each value represents a single ssi_clk delay on the sample of rxd. Note: If this register is programmed with a value that exceeds the depth of the internal shift registers (SSI_RX_DLY_SR_DEPTH) zero delay will be applied to the rxd sample.

#### 14.16.2.62 RSVD — Offset 481020FCh

#### 14.16.3.1 CTRLR0 – Offset 48104000h

Control Register 0 - This register controls the serial data transfer. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: SSI\_CTRLR0\_RST

Type	Size	Offset	Default
MMIO	32 bit	48104000h	01000007h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	<b>Reserved</b>
24	1h RW	<b>SSTE:</b> Slave Select Toggle Enable. When operating in SPI mode with clock phase (SCPH) set to 0, this register controls the behavior of the slave select line (ss_*_n) between data frames. If this register field is set to 1 the ss_*_n line will toggle between consecutive data frames, with the serial clock (sclk) being held to its default value while ss_*_n is high; if this register field is set to 0 the ss_*_n will stay low and sclk will run continuously for the duration of the transfer. Note: This register is only valid when SSI_SCPH0_SSTOOGLE is set to 1.
23	0h RO	<b>Reserved</b>
22:21	0h RO/V	<b>SPI_FRF:</b> SPI Frame Format: Selects data frame format for Transmitting/Receiving the data Bits only valid when SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode. When SSI_SPI_MODE is configured for "Dual Mode", 10/11 combination is reserved. When SSI_SPI_MODE is configured for "Quad Mode", 11 combination is reserved.
20:16	00h RO/V	<b>DFS_32:</b> Data Frame Size in 32-bit transfer size mode. Used to select the data frame size in 32-bit transfer mode. These bits are only valid when SSI_MAX_XFER_SIZE is configured to 32. When the data frame size is programmed to be less than 32 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You are responsible for making sure that transmit data is right-justified before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data. Note: When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 0x01, - DFS value should be multiple of 4 if SPI_FRF = 0x10, - DFS value should be multiple of 8 if SPI_FRF = 0x11.
15:12	0h RW	<b>CFS:</b> Control Frame Size. Selects the length of the control word for the Microwire frame format.
11	0h RW	<b>SRL:</b> Shift Register Loop. Used for testing purposes only. When internally active, connects the transmit shift register output to the receive shift register input. Can be used in both serial-slave and serial-master modes. When the DW_apb_ssi is configured as a slave in loopback mode, the ss_in_n and ssi_clk signals must be provided by an external source. In this mode, the slave cannot generate these signals because there is nothing to which to loop back
10	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RW	<b>TMOD:</b> Transfer Mode. Selects the mode of transfer for serial communication. This field does not affect the transfer duplicity. Only indicates whether the receive or transmit data are valid. In transmit-only mode, data received from the external device is not valid and is not stored in the receive FIFO memory; it is overwritten on the next transfer. In receive-only mode, transmitted data are not valid. After the first write to the transmit FIFO, the same word is retransmitted for the duration of the transfer. In transmit-and-receive mode, both transmit and receive data are valid. The transfer continues until the transmit FIFO is empty. Data received from the external device are stored into the receive FIFO memory, where it can be accessed by the host processor. In eeprom-read mode, receive data is not valid while control data is being transmitted. When all control data is sent to the EEPROM, receive data becomes valid and transmit data becomes invalid. All data in the transmit FIFO is considered control data in this mode. This transfer mode is only valid when the DW_apb_ssi is configured as master device. 00 - Transmit & Receive 01 - Transmit Only 10 - Receive Only 11 - EEPROM Read When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. There are only two valid combinations: 10 - Read 01 - Write
7	0h RW	<b>SCPOL:</b> Serial Clock Polarity. Valid when the frame format (FRF) is set to Motorola SPI. Used to select the polarity of the inactive serial clock, which is held inactive when the DW_apb_ssi master is not actively transferring data on the serial bus.
6	0h RW	<b>SCPH:</b> Serial Clock Phase. Valid when the frame format (FRF) is set to Motorola SPI. The serial clock phase selects the relationship of the serial clock with the slave select signal. When SCPH = 0, data are captured on the first edge of the serial clock. When SCPH = 1, the serial clock starts toggling one cycle after the slave select line is activated, and data are captured on the second edge of the serial clock.
5:4	0h RW	<b>FRF:</b> Frame Format. Selects which serial protocol transfers the data.
3:0	7h RW	<b>DFS:</b> Data Frame Size. This register field is only valid when SSI_MAX_XFER_SIZE is configured to 16. If SSI_MAX_XFER_SIZE is configured to 32, then writing to this field will not have any effect. Selects the data frame length. When the data frame size is programmed to be less than 16 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You must right-justify transmit data before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data Note: When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 01, - DFS value should be multiple of 4 if SPI_FRF = 10, - DFS value should be multiple of 8 if SPI_FRF = 11.

#### 14.16.3.2 CTRLR1 – Offset 48104004h

Control Register 1 - This register exists only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. Control register 1 controls the end of serial transfers when in receive-only mode. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>NDF:</b> Number of Data Frames. When TMOD = 10 or TMOD = 11 , this register field sets the number of data frames to be continuously received by the DW_apb_ssi. The DW_apb_ssi continues to receive serial data until the number of data frames received is equal to this register value plus 1, which enables you to receive up to 64 KB of data in a continuous transfer. When the DW_apb_ssi is configured as a serial slave, the transfer continues for as long as the slave is selected. Therefore, this register serves no purpose and is not present when the DW_apb_ssi is configured as a serial slave.

### 14.16.3.3 SSIENR — Offset 48104008h

SSI Enable Register - This register enables and disables the DW\_apb\_ssi. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>SSI_EN:</b> SSI Enable. Enables and disables all DW_apb_ssi operations. When disabled, all serial transfers are halted immediately. Transmit and receive FIFO buffers are cleared when the device is disabled. It is impossible to program some of the DW_apb_ssi control registers when enabled. When disabled, the ssi_sleep output is set (after delay) to inform the system that it is safe to remove the ssi_clk, thus saving power consumption in the system.

#### 14.16.3.4 MWCR — Offset 4810400Ch

Microwire Control Register - This register controls the direction of the data word for the half-duplex Microwire serial protocol. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810400Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2	0h RW	<b>MHS:</b> Microwire Handshaking. Relevant only when the DW_apb_ssi is configured as a serial-master device. When configured as a serial slave, this bit field has no functionality. Used to enable and disable the busy/ready handshaking interface for the Microwire protocol. When enabled, the DW_apb_ssi checks for a ready status from the target slave, after the transfer of the last data/control bit, before clearing the BUSY status in the SR register.
1	0h RW	<b>MDD:</b> Microwire Control. Defines the direction of the data word when the Microwire serial protocol is used. When this bit is set to 0, the data word is received by the DW_apb_ssi MacroCell from the external serial device. When this bit is set to 1, the data word is transmitted from the DW_apb_ssi MacroCell to the external serial device.
0	0h RW	<b>MWMOD:</b> Microwire Transfer Mode. Defines whether the Microwire transfer is sequential or non-sequential. When sequential mode is used, only one control word is needed to transmit or receive a block of data words. When non-sequential mode is used, there must be a control word for each data word that is transmitted or received.

#### 14.16.3.5 SER — Offset 48104010h

Slave Enable Register - This register is valid only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register enables the individual slave select output lines from the DW\_apb\_ssi master. Up to 16 slave-select output pins are available on the DW\_apb\_ssi master. Register bits can be set or cleared when SSI\_EN=0. If SSI\_EN=1, then register bits can be set (to delay the slave select assertion while TX FIFO is getting filled) but cannot be cleared. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>SER:</b> Slave Select Enable Flag. Each bit in this register corresponds to a slave select line (ss_x_n) from the DW_apb_ssi master. When a bit in this register is set (1), the corresponding slave select line from the master is activated when a serial transfer begins. It should be noted that setting or clearing bits in this register have no effect on the corresponding slave select outputs until a transfer is started. Before beginning a transfer, you should enable the bit in this register that corresponds to the slave device with which the master wants to communicate. When not operating in broadcast mode, only one bit in this field should be set.

#### 14.16.3.6 BAUDR — Offset 48104014h

Baud Rate Select - This register is valid only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register derives the frequency of the serial clock that regulates the data transfer. The 16-bit field in this register defines the ssi\_clk divider value. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>SCKDV:</b> SSI Clock Divider. The LSB for this field is always set to 0 and is unaffected by a write operation, which ensures an even value is held in this register. If the value is 0, the serial output clock (sclk_out) is disabled. The frequency of the sclk_out is derived from the following equation: Fsclk_out = Fssi_clk/SCKDV where SCKDV is any even value between 2 and 65534. For example: for Fssi_clk = 3.6864MHz and SCKDV = 2 Fsclk_out = 3.6864/2 = 1.8432MHz

### 14.16.3.7 TXFTLR — Offset 48104018h

Transmit FIFO Threshold Level - This register controls the threshold value for the transmit FIFO memory. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>TFT:</b> Transmit FIFO Threshold. Controls the level of entries (or below) at which the transmit FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256; this register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than or equal to the depth of the FIFO, this field is not written and retains its current value. When the number of transmit FIFO entries is less than or equal to this value, the transmit FIFO empty interrupt is triggered. For information on the Transmit FIFO Threshold values, see the "Master SPI and SSP Serial Transfers" in the DW_apb_ssi Databook. ssi_txe_intr is asserted when TFT or less data entries are present in transmit FIFO

### 14.16.3.8 RXFTLR — Offset 4810401Ch

Receive FIFO Threshold Level - This register controls the threshold value for the receive FIFO memory. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810401Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>RFT:</b> Receive FIFO Threshold. Controls the level of entries (or above) at which the receive FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256. This register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than the depth of the FIFO, this field is not written and retains its current value. When the number of receive FIFO entries is greater than or equal to this value + 1, the receive FIFO full interrupt is triggered. For information on the Receive FIFO Threshold values, see the "Master SPI and SSP Serial Transfers" in the DW_apb_ssi Databook. ssi_rxf_intr is asserted when RFT or more data entries are present in receive FIFO.

#### 14.16.3.9 TXFLR — Offset 48104020h

Transmit FIFO Level Register - This register contains the number of valid data entries in the transmit FIFO memory. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TXTFL:</b> Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

#### 14.16.3.10 RXFLR — Offset 48104024h

Receive FIFO Level Register - This register contains the number of valid data entries in the receive FIFO memory. This register can be ready at any time. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RXTFL:</b> Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

#### 14.16.3.11 SR – Offset 48104028h

Status Register - This is a read-only register used to indicate the current transfer status, FIFO status, and any transmission/reception errors that may have occurred. The status register may be read at any time. None of the bits in this register request an interrupt. Reset Value: 0x6

Type	Size	Offset	Default
MMIO	32 bit	48104028h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>DCOL:</b> Data Collision Error. Relevant only when the DW_apb_ssi is configured as a master device. This bit will be set if ss_in_n input is asserted by other master, when the DW_apb_ssi master is in the middle of the transfer. This informs the processor that the last data transfer was halted before completion. This bit is cleared when read.
5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. Set when the receive FIFO contains one or more entries and is cleared when the receive FIFO is empty. This bit can be polled by software to completely empty the receive FIFO.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. When the transmit FIFO is completely empty, this bit is set. When the transmit FIFO contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full.
0	0h RO/V	<b>BUSY:</b> SSI Busy Flag. When set, indicates that a serial transfer is in progress; when cleared indicates that the DW_apb_ssi is idle or disabled.

#### 14.16.3.12 IMR – Offset 4810402Ch

Interrupt Mask Register - This read/write register masks or enables all interrupts generated by the DW\_apb\_ssi. When the DW\_apb\_ssi is configured as a slave device, the MSTIM bit field is not present. This changes the reset value from 0x3F for serial-master configurations to 0x1F for serial-slave configurations. Reset Value: (SSI\_IS\_MASTER == 1) ? 0x3F : 0x1F

Type	Size	Offset	Default
MMIO	32 bit	4810402Ch	0000003Fh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	1h RW	<b>MSTIM:</b> Multi-Master Contention Interrupt Mask. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	1h RW	<b>RXFIM:</b> Receive FIFO Full Interrupt Mask
3	1h RW	<b>RXOIM:</b> Receive FIFO Overflow Interrupt Mask
2	1h RW	<b>RXUIM:</b> Receive FIFO Underflow Interrupt Mask
1	1h RW	<b>TXOIM:</b> Transmit FIFO Overflow Interrupt Mask
0	1h RW	<b>TXEIM:</b> Transmit FIFO Empty Interrupt Mask

#### 14.16.3.13 ISR – Offset 48104030h

Interrupt Status Register - This register reports the status of the DW\_apb\_ssi interrupts after they have been masked. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>MSTIS:</b> Multi-Master Contention Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	<b>RXFIS:</b> Receive FIFO Full Interrupt Status
3	0h RO/V	<b>RXOIS:</b> Receive FIFO Overflow Interrupt Status
2	0h RO/V	<b>RXUIS:</b> Receive FIFO Underflow Interrupt Status
1	0h RO/V	<b>TXOIS:</b> Transmit FIFO Overflow Interrupt Status
0	0h RO/V	<b>TXEIS:</b> Transmit FIFO Empty Interrupt Status

#### 14.16.3.14 RISR — Offset 48104034h

Raw Interrupt Status Register - This read-only register reports the status of the DW\_apb\_ssi interrupts prior to masking. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>MSTIR:</b> Multi-Master Contention Raw Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	<b>RXFIR:</b> Receive FIFO Full Raw Interrupt Status
3	0h RO/V	<b>RXOIR:</b> Receive FIFO Overflow Raw Interrupt Status
2	0h RO/V	<b>RXUIR:</b> Receive FIFO Underflow Raw Interrupt Status
1	0h RO/V	<b>TXOIR:</b> Transmit FIFO Overflow Raw Interrupt Status
0	0h RO/V	<b>TXEIR:</b> Transmit FIFO Empty Raw Interrupt Status

#### 14.16.3.15 TXOICR — Offset 48104038h

Transmit FIFO Overflow Interrupt Clear Register Register - Transmit FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TXOICR:</b> Clear Transmit FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_txo_intr interrupt; writing has no effect.

### 14.16.3.16 RXOICR — Offset 4810403Ch

Receive FIFO Overflow Interrupt Clear Register - Receive FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810403Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>RXOICR:</b> Clear Receive FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxo_intr interrupt; writing has no effect.

### 14.16.3.17 RXUICR — Offset 48104040h

Receive FIFO Underflow Interrupt Clear Register - Receive FIFO Underflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>RXUICR:</b> Clear Receive FIFO Underflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxu_intr interrupt; writing has no effect.

### 14.16.3.18 MSTICR — Offset 48104044h

Multi-Master Interrupt Clear Register - Multi-Master Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>MSTICR:</b> Clear Multi-Master Contention Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_mst_intr interrupt; writing has no effect.

#### 14.16.3.19 ICR — Offset 48104048h

Interrupt Clear Register - Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>ICR:</b> Clear Interrupts. This register is set if any of the interrupts below are active. A read clears the ssi_txo_intr, ssi_rxu_intr, ssi_rxo_intr, and the ssi_mst_intr interrupts. Writing to this register has no effect.

#### 14.16.3.20 DMACR — Offset 4810404Ch

DMA Control Register - This register is only valid when DW\_apb\_ssi is configured with a set of DMA Controller interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to the register's address will have no effect; reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810404Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>TDMAE:</b> Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	<b>RDMAE:</b> Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel

#### 14.16.3.21 DMATDLR – Offset 48104050h

DMA Transmit Data Level - This register is only valid when the DW\_apb\_ssi is configured with a set of DMA interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>DMATDL:</b> Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1. For information on the DMATDL decode values, see the "Slave SPI and SSP Serial Transfers" section in the DW_apb_ssi Databook. dma_tx_req is asserted when DMATDL or less data entries are present in the transmit FIFO

#### 14.16.3.22 DMARDLR – Offset 48104054h

DMA Receive Data Level - This register is only valid when DW\_apb\_ssi is configured with a set of DMA interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>DMARDL:</b> Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or above this field value + 1, and RDMAE=1. For information on the DMARDL decode values, see the "Slave SPI and SSP Serial Transfers" section in the DW_apb_ssi Databook. dma_rx_req is asserted when DMARDL or more valid data entries are present in the receive FIFO.

#### 14.16.3.23 IDR – Offset 48104058h

Identification Register - This register contains the peripherals identification code, which is written into the register at configuration time using coreConsultant. Reset Value: SSI\_ID

Type	Size	Offset	Default
MMIO	32 bit	48104058h	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFh RO/V	<b>IDCODE:</b> Identification code. The register contains the peripheral's identification code, which is written into the register at configuration time using CoreConsultant.

#### 14.16.3.24 SSI\_VERSION\_ID – Offset 4810405Ch

coreKit version ID Register - This read-only register stores the specific DW\_apb\_ssi component version. Reset Value: SSI\_VERSION\_ID

Type	Size	Offset	Default
MMIO	32 bit	4810405Ch	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>SSI_COMP_VERSION:</b> Contains the hex representation of the Synopsys component version. Consists of ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*.

#### 14.16.3.25 DR0 – Offset 48104060h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48104060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW/V	<b>DR:</b> Data Register. When writing to this register, you must right-justify the data. Read data are automatically right-justified. If SSI_MAX_XFER_SIZE configuration parameter is set to 32, all 32 bits are valid. Otherwise, only 16 bits ([15:0]) of the register are valid. Read = Receive FIFO buffer Write = Transmit FIFO buffer.

#### 14.16.3.26 DR1 – Offset 48104064h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.27 DR2 – Offset 48104068h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

### 14.16.3.28 DR3 – Offset 4810406Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

### 14.16.3.29 DR4 – Offset 48104070h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

### 14.16.3.30 DR5 – Offset 48104074h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

### 14.16.3.31 DR6 – Offset 48104078h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read,

data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.32 DR7 – Offset 4810407Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.33 DR8 – Offset 48104080h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.34 DR9 – Offset 48104084h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus

into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.35 DR10 – Offset 48104088h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.36 DR11 – Offset 4810408Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.37 DR12 – Offset 48104090h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.38 DR13 – Offset 48104094h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.39 DR14 – Offset 48104098h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.40 DR15 – Offset 4810409Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. **Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.52 DR27 — Offset 481040CCh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.53 DR28 — Offset 481040D0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.54 DR29 — Offset 481040D4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus

into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.55 DR30 – Offset 481040D8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.56 DR31 – Offset 481040DCh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.57 DR32 – Offset 481040E0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.58 DR33 – Offset 481040E4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pldata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.59 DR34 – Offset 481040E8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pldata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.60 DR35 – Offset 481040ECh

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pldata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48104060h.

#### 14.16.3.61 RX\_SAMPLE\_DLY – Offset 481040F0h

RX Sample Delay Register - This register is only valid when the DW\_apb\_ssi is configured with rxd sample delay logic (SSI\_HAS\_RX\_SAMPLE\_DELAY==1). When the DW\_apb\_ssi is not configured with rxd sample delay logic, this register will not exist and writing to its address location will have no effect; reading from its address will

return zero. This register control the number of ssi\_clk cycles that are delayed (from the default sample time) before the actual sample of the rxd input occurs. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	481040F0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RSD:</b> Rxd Sample Delay. This register is used to delay the sample of the rxd input port. Each value represents a single ssi_clk delay on the sample of rxd. Note: If this register is programmed with a value that exceeds the depth of the internal shift registers (SSI_RX_DLY_SR_DEPTH) zero delay will be applied to the rxd sample.

#### 14.16.4.1 CTRLR0 – Offset 48106000h

Control Register 0 - This register controls the serial data transfer. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: SSI\_CTRLR0\_RST

Type	Size	Offset	Default
MMIO	32 bit	48106000h	01000007h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	<b>Reserved</b>
24	1h RW	<b>SSTE:</b> Slave Select Toggle Enable. When operating in SPI mode with clock phase (SCPH) set to 0, this register controls the behavior of the slave select line (ss_*_n) between data frames. If this register field is set to 1 the ss_*_n line will toggle between consecutive data frames, with the serial clock (sclk) being held to its default value while ss_*_n is high; if this register field is set to 0 the ss_*_n will stay low and sclk will run continuously for the duration of the transfer. Note: This register is only valid when SSI_SCPH0_SSTOOGLE is set to 1.
23	0h RO	<b>Reserved</b>
22:21	0h RO/V	<b>SPI_FRF:</b> SPI Frame Format: Selects data frame format for Transmitting/Receiving the data Bits only valid when SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode. When SSI_SPI_MODE is configured for "Dual Mode", 10/11 combination is reserved. When SSI_SPI_MODE is configured for "Quad Mode", 11 combination is reserved.
20:16	00h RO/V	<b>DFS_32:</b> Data Frame Size in 32-bit transfer size mode. Used to select the data frame size in 32-bit transfer mode. These bits are only valid when SSI_MAX_XFER_SIZE is configured to 32. When the data frame size is programmed to be less than 32 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You are responsible for making sure that transmit data is right-justified before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data. Note: When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 0x01, - DFS value should be multiple of 4 if SPI_FRF = 0x10, - DFS value should be multiple of 8 if SPI_FRF = 0x11.
15:12	0h RW	<b>CFS:</b> Control Frame Size. Selects the length of the control word for the Microwire frame format.
11	0h RW	<b>SRL:</b> Shift Register Loop. Used for testing purposes only. When internally active, connects the transmit shift register output to the receive shift register input. Can be used in both serial-slave and serial-master modes. When the DW_apb_ssi is configured as a slave in loopback mode, the ss_in_n and ssi_clk signals must be provided by an external source. In this mode, the slave cannot generate these signals because there is nothing to which to loop back
10	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RW	<b>TMOD:</b> Transfer Mode. Selects the mode of transfer for serial communication. This field does not affect the transfer duplicity. Only indicates whether the receive or transmit data are valid. In transmit-only mode, data received from the external device is not valid and is not stored in the receive FIFO memory; it is overwritten on the next transfer. In receive-only mode, transmitted data are not valid. After the first write to the transmit FIFO, the same word is retransmitted for the duration of the transfer. In transmit-and-receive mode, both transmit and receive data are valid. The transfer continues until the transmit FIFO is empty. Data received from the external device are stored into the receive FIFO memory, where it can be accessed by the host processor. In eeprom-read mode, receive data is not valid while control data is being transmitted. When all control data is sent to the EEPROM, receive data becomes valid and transmit data becomes invalid. All data in the transmit FIFO is considered control data in this mode. This transfer mode is only valid when the DW_apb_ssi is configured as master device. 00 - Transmit & Receive 01 - Transmit Only 10 - Receive Only 11 - EEPROM Read When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. There are only two valid combinations: 10 - Read 01 - Write
7	0h RW	<b>SCPOL:</b> Serial Clock Polarity. Valid when the frame format (FRF) is set to Motorola SPI. Used to select the polarity of the inactive serial clock, which is held inactive when the DW_apb_ssi master is not actively transferring data on the serial bus.
6	0h RW	<b>SCPH:</b> Serial Clock Phase. Valid when the frame format (FRF) is set to Motorola SPI. The serial clock phase selects the relationship of the serial clock with the slave select signal. When SCPH = 0, data are captured on the first edge of the serial clock. When SCPH = 1, the serial clock starts toggling one cycle after the slave select line is activated, and data are captured on the second edge of the serial clock.
5:4	0h RW	<b>FRF:</b> Frame Format. Selects which serial protocol transfers the data.
3:0	7h RW	<b>DFS:</b> Data Frame Size. This register field is only valid when SSI_MAX_XFER_SIZE is configured to 16. If SSI_MAX_XFER_SIZE is configured to 32, then writing to this field will not have any effect. Selects the data frame length. When the data frame size is programmed to be less than 16 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. You must right-justify transmit data before writing into the transmit FIFO. The transmit logic ignores the upper unused bits when transmitting the data Note: When SSI_SPI_MODE is either set to "Dual" or "Quad" or "Octal" mode and SPI_FRF is not set to 2'b00. - DFS value should be multiple of 2 if SPI_FRF = 01, - DFS value should be multiple of 4 if SPI_FRF = 10, - DFS value should be multiple of 8 if SPI_FRF = 11.

#### 14.16.4.2 CTRLR1 – Offset 48106004h

Control Register 1 - This register exists only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. Control register 1 controls the end of serial transfers when in receive-only mode. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>NDF:</b> Number of Data Frames. When TMOD = 10 or TMOD = 11 , this register field sets the number of data frames to be continuously received by the DW_apb_ssi. The DW_apb_ssi continues to receive serial data until the number of data frames received is equal to this register value plus 1, which enables you to receive up to 64 KB of data in a continuous transfer. When the DW_apb_ssi is configured as a serial slave, the transfer continues for as long as the slave is selected. Therefore, this register serves no purpose and is not present when the DW_apb_ssi is configured as a serial slave.

#### 14.16.4.3 SSIENR — Offset 48106008h

SSI Enable Register - This register enables and disables the DW\_apb\_ssi. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>SSI_EN:</b> SSI Enable. Enables and disables all DW_apb_ssi operations. When disabled, all serial transfers are halted immediately. Transmit and receive FIFO buffers are cleared when the device is disabled. It is impossible to program some of the DW_apb_ssi control registers when enabled. When disabled, the ssi_sleep output is set (after delay) to inform the system that it is safe to remove the ssi_clk, thus saving power consumption in the system.

#### 14.16.4.4 MWCR — Offset 4810600Ch

Microwire Control Register - This register controls the direction of the data word for the half-duplex Microwire serial protocol. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810600Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2	0h RW	<b>MHS:</b> Microwire Handshaking. Relevant only when the DW_apb_ssi is configured as a serial-master device. When configured as a serial slave, this bit field has no functionality. Used to enable and disable the busy/ready handshaking interface for the Microwire protocol. When enabled, the DW_apb_ssi checks for a ready status from the target slave, after the transfer of the last data/control bit, before clearing the BUSY status in the SR register.
1	0h RW	<b>MDD:</b> Microwire Control. Defines the direction of the data word when the Microwire serial protocol is used. When this bit is set to 0, the data word is received by the DW_apb_ssi MacroCell from the external serial device. When this bit is set to 1, the data word is transmitted from the DW_apb_ssi MacroCell to the external serial device.
0	0h RW	<b>MWMOD:</b> Microwire Transfer Mode. Defines whether the Microwire transfer is sequential or non-sequential. When sequential mode is used, only one control word is needed to transmit or receive a block of data words. When non-sequential mode is used, there must be a control word for each data word that is transmitted or received.

#### 14.16.4.5 SER — Offset 48106010h

Slave Enable Register - This register is valid only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register enables the individual slave select output lines from the DW\_apb\_ssi master. Up to 16 slave-select output pins are available on the DW\_apb\_ssi master. Register bits can be set or cleared when SSI\_EN=0. If SSI\_EN=1, then register bits can be set (to delay the slave select assertion while TX FIFO is getting filled) but cannot be cleared. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>SER:</b> Slave Select Enable Flag. Each bit in this register corresponds to a slave select line (ss_x_n) from the DW_apb_ssi master. When a bit in this register is set (1), the corresponding slave select line from the master is activated when a serial transfer begins. It should be noted that setting or clearing bits in this register have no effect on the corresponding slave select outputs until a transfer is started. Before beginning a transfer, you should enable the bit in this register that corresponds to the slave device with which the master wants to communicate. When not operating in broadcast mode, only one bit in this field should be set.

#### 14.16.4.6 BAUDR — Offset 48106014h

Baud Rate Select - This register is valid only when the DW\_apb\_ssi is configured as a master device. When the DW\_apb\_ssi is configured as a serial slave, writing to this location has no effect; reading from this location returns 0. The register derives the frequency of the serial clock that regulates the data transfer. The 16-bit field in this register defines the ssi\_clk divider value. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>SCKDV:</b> SSI Clock Divider. The LSB for this field is always set to 0 and is unaffected by a write operation, which ensures an even value is held in this register. If the value is 0, the serial output clock (sclk_out) is disabled. The frequency of the sclk_out is derived from the following equation: Fsclk_out = Fssi_clk/SCKDV where SCKDV is any even value between 2 and 65534. For example: for Fssi_clk = 3.6864MHz and SCKDV = 2 Fsclk_out = 3.6864/2 = 1.8432MHz

#### 14.16.4.7 TXFTLR — Offset 48106018h

Transmit FIFO Threshold Level - This register controls the threshold value for the transmit FIFO memory. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>TFT:</b> Transmit FIFO Threshold. Controls the level of entries (or below) at which the transmit FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256; this register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than or equal to the depth of the FIFO, this field is not written and retains its current value. When the number of transmit FIFO entries is less than or equal to this value, the transmit FIFO empty interrupt is triggered. For information on the Transmit FIFO Threshold values, see the "Master SPI and SSP Serial Transfers" in the DW_apb_ssi Databook. ssi_txe_intr is asserted when TFT or less data entries are present in transmit FIFO

#### 14.16.4.8 RXFTLR — Offset 4810601Ch

Receive FIFO Threshold Level - This register controls the threshold value for the receive FIFO memory. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810601Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>RFT:</b> Receive FIFO Threshold. Controls the level of entries (or above) at which the receive FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2-256. This register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than the depth of the FIFO, this field is not written and retains its current value. When the number of receive FIFO entries is greater than or equal to this value + 1, the receive FIFO full interrupt is triggered. For information on the Receive FIFO Threshold values, see the "Master SPI and SSP Serial Transfers" in the DW_apb_ssi Databook. ssi_rxf_intr is asserted when RFT or more data entries are present in receive FIFO.

#### 14.16.4.9 TXFLR — Offset 48106020h

Transmit FIFO Level Register - This register contains the number of valid data entries in the transmit FIFO memory. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TXTFL:</b> Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.

#### 14.16.4.10 RXFLR — Offset 48106024h

Receive FIFO Level Register - This register contains the number of valid data entries in the receive FIFO memory. This register can be ready at any time. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RXTFL:</b> Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

#### 14.16.4.11 SR – Offset 48106028h

Status Register - This is a read-only register used to indicate the current transfer status, FIFO status, and any transmission/reception errors that may have occurred. The status register may be read at any time. None of the bits in this register request an interrupt. Reset Value: 0x6

Type	Size	Offset	Default
MMIO	32 bit	48106028h	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>DCOL:</b> Data Collision Error. Relevant only when the DW_apb_ssi is configured as a master device. This bit will be set if ss_in_n input is asserted by other master, when the DW_apb_ssi master is in the middle of the transfer. This informs the processor that the last data transfer was halted before completion. This bit is cleared when read.
5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. Set when the receive FIFO contains one or more entries and is cleared when the receive FIFO is empty. This bit can be polled by software to completely empty the receive FIFO.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. When the transmit FIFO is completely empty, this bit is set. When the transmit FIFO contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full.
0	0h RO/V	<b>BUSY:</b> SSI Busy Flag. When set, indicates that a serial transfer is in progress; when cleared indicates that the DW_apb_ssi is idle or disabled.

#### 14.16.4.12 IMR – Offset 4810602Ch

Interrupt Mask Register - This read/write register masks or enables all interrupts generated by the DW\_apb\_ssi. When the DW\_apb\_ssi is configured as a slave device, the MSTIM bit field is not present. This changes the reset value from 0x3F for serial-master configurations to 0x1F for serial-slave configurations. Reset Value: (SSI\_IS\_MASTER == 1) ? 0x3F : 0x1F

Type	Size	Offset	Default
MMIO	32 bit	4810602Ch	0000003Fh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	1h RW	<b>MSTIM:</b> Multi-Master Contention Interrupt Mask. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	1h RW	<b>RXFIM:</b> Receive FIFO Full Interrupt Mask
3	1h RW	<b>RXOIM:</b> Receive FIFO Overflow Interrupt Mask
2	1h RW	<b>RXUIM:</b> Receive FIFO Underflow Interrupt Mask
1	1h RW	<b>TXOIM:</b> Transmit FIFO Overflow Interrupt Mask
0	1h RW	<b>TXEIM:</b> Transmit FIFO Empty Interrupt Mask

#### 14.16.4.13 ISR – Offset 48106030h

Interrupt Status Register - This register reports the status of the DW\_apb\_ssi interrupts after they have been masked. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>MSTIS:</b> Multi-Master Contention Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	<b>RXFIS:</b> Receive FIFO Full Interrupt Status
3	0h RO/V	<b>RXOIS:</b> Receive FIFO Overflow Interrupt Status
2	0h RO/V	<b>RXUIS:</b> Receive FIFO Underflow Interrupt Status
1	0h RO/V	<b>TXOIS:</b> Transmit FIFO Overflow Interrupt Status
0	0h RO/V	<b>TXEIS:</b> Transmit FIFO Empty Interrupt Status

#### 14.16.4.14 RISR — Offset 48106034h

Raw Interrupt Status Register - This read-only register reports the status of the DW\_apb\_ssi interrupts prior to masking. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>MSTIR:</b> Multi-Master Contention Raw Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device.
4	0h RO/V	<b>RXFIR:</b> Receive FIFO Full Raw Interrupt Status
3	0h RO/V	<b>RXOIR:</b> Receive FIFO Overflow Raw Interrupt Status
2	0h RO/V	<b>RXUIR:</b> Receive FIFO Underflow Raw Interrupt Status
1	0h RO/V	<b>TXOIR:</b> Transmit FIFO Overflow Raw Interrupt Status
0	0h RO/V	<b>TXEIR:</b> Transmit FIFO Empty Raw Interrupt Status

#### 14.16.4.15 TXOICR — Offset 48106038h

Transmit FIFO Overflow Interrupt Clear Register Register - Transmit FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TXOICR:</b> Clear Transmit FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_txo_intr interrupt; writing has no effect.

#### 14.16.4.16 RXOICR — Offset 4810603Ch

Receive FIFO Overflow Interrupt Clear Register - Receive FIFO Overflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810603Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>RXOICR:</b> Clear Receive FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxo_intr interrupt; writing has no effect.

#### 14.16.4.17 RXUICR — Offset 48106040h

Receive FIFO Underflow Interrupt Clear Register - Receive FIFO Underflow Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>RXUICR:</b> Clear Receive FIFO Underflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxu_intr interrupt; writing has no effect.

#### 14.16.4.18 MSTICR — Offset 48106044h

Multi-Master Interrupt Clear Register - Multi-Master Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>MSTICR:</b> Clear Multi-Master Contention Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_mst_intr interrupt; writing has no effect.

#### 14.16.4.19 ICR — Offset 48106048h

Interrupt Clear Register - Interrupt Clear Register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>ICR:</b> Clear Interrupts. This register is set if any of the interrupts below are active. A read clears the ssi_txo_intr, ssi_rxu_intr, ssi_rxo_intr, and the ssi_mst_intr interrupts. Writing to this register has no effect.

#### 14.16.4.20 DMACR — Offset 4810604Ch

DMA Control Register - This register is only valid when DW\_apb\_ssi is configured with a set of DMA Controller interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to the register's address will have no effect; reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	4810604Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>TDMAE:</b> Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.
0	0h RW	<b>RDMAE:</b> Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel

#### 14.16.4.21 DMATDLR – Offset 48106050h

DMA Transmit Data Level - This register is only valid when the DW\_apb\_ssi is configured with a set of DMA interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>DMATDL:</b> Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1. For information on the DMATDL decode values, see the "Slave SPI and SSP Serial Transfers" section in the DW_apb_ssi Databook. dma_tx_req is asserted when DMATDL or less data entries are present in the transmit FIFO

#### 14.16.4.22 DMARDLR – Offset 48106054h

DMA Receive Data Level - This register is only valid when DW\_apb\_ssi is configured with a set of DMA interface signals (SSI\_HAS\_DMA = 1). When DW\_apb\_ssi is not configured for DMA operation, this register will not exist and writing to its address will have no effect; reading from its address will return zero. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RW	<b>DMARDL:</b> Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or above this field value + 1, and RDMAE=1. For information on the DMARDL decode values, see the "Slave SPI and SSP Serial Transfers" section in the DW_apb_ssi Databook. dma_rx_req is asserted when DMARDL or more valid data entries are present in the receive FIFO.

#### 14.16.4.23 IDR – Offset 48106058h

Identification Register - This register contains the peripherals identification code, which is written into the register at configuration time using coreConsultant. Reset Value: SSI\_ID

Type	Size	Offset	Default
MMIO	32 bit	48106058h	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFh RO/V	<b>IDCODE:</b> Identification code. The register contains the peripheral's identification code, which is written into the register at configuration time using CoreConsultant.

#### 14.16.4.24 SSI\_VERSION\_ID – Offset 4810605Ch

coreKit version ID Register - This read-only register stores the specific DW\_apb\_ssi component version. Reset Value: SSI\_VERSION\_ID

Type	Size	Offset	Default
MMIO	32 bit	4810605Ch	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>SSI_COMP_VERSION:</b> Contains the hex representation of the Synopsys component version. Consists of ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*.

#### 14.16.4.25 DR0 – Offset 48106060h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the pdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	48106060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW/V	<b>DR:</b> Data Register. When writing to this register, you must right-justify the data. Read data are automatically right-justified. If SSI_MAX_XFER_SIZE configuration parameter is set to 32, all 32 bits are valid. Otherwise, only 16 bits ([15:0]) of the register are valid. Read = Receive FIFO buffer Write = Transmit FIFO buffer.

#### 14.16.4.26 DR1 – Offset 48106064h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.27 DR2 – Offset 48106068h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.28 DR3 – Offset 4810606Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.29 DR4 – Offset 48106070h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.30 DR5 – Offset 48106074h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.31 DR6 – Offset 48106078h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read,

data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.32 DR7 – Offset 4810607Ch

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.33 DR8 – Offset 48106080h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.34 DR9 – Offset 48106084h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus

into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.35 DR10 – Offset 48106088h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.57 DR32 – Offset 481060E0h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pwdata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.58 DR33 – Offset 481060E4h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.59 DR34 – Offset 481060E8h

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.60 DR35 – Offset 481060EC<sub>h</sub>

Data Register x - The DW\_apb\_ssi data register is a 16/32-bit (depending on SSI\_MAX\_XFER\_SIZE) read/write buffer for the transmit/receive FIFOs. If the configuration parameter SSI\_MAX\_XFER\_SIZE is set to 32, then all 32 bits are valid, otherwise, only 16 bits ([15:0]) of the register are valid. When the register is read, data in the receive FIFO buffer is accessed. When it is written to, data are moved into the transmit FIFO buffer; a write can occur only when SSI\_EN = 1. FIFOs are reset when SSI\_EN = 0. NOTE: The DR register in the DW\_apb\_ssi occupies thirty-six 32-bit address locations of the memory map to facilitate AHB burst transfers. Writing to any of these address locations has the same effect as pushing the data from the pldata bus into the transmit FIFO. Reading from any of these locations has the same effect as popping data from the receive FIFO onto the prdata bus. The FIFO buffers on the DW\_apb\_ssi are not addressable. Reset Value: 0x0

**Note:** Bit definitions are the same as DR0, offset 48106060h.

#### 14.16.4.61 RX\_SAMPLE\_DLY – Offset 481060F0<sub>h</sub>

RX Sample Delay Register - This register is only valid when the DW\_apb\_ssi is configured with rxd sample delay logic (SSI\_HAS\_RX\_SAMPLE\_DELAY==1). When the DW\_apb\_ssi is not configured with rxd sample delay logic, this register will not exist and writing to its address location will have no effect; reading from its address will

return zero. This register control the number of ssi\_clk cycles that are delayed (from the default sample time) before the actual sample of the rxd input occurs. It is impossible to write to this register when the DW\_apb\_ssi is enabled. The DW\_apb\_ssi is enabled and disabled by writing to the SSIENR register. Reset Value: 0x0

Type	Size	Offset	Default
MMIO	32 bit	481060F0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RSD:</b> Rxd Sample Delay. This register is used to delay the sample of the rxd input port. Each value represents a single ssi_clk delay on the sample of rxd. Note: If this register is programmed with a value that exceeds the depth of the internal shift registers (SSI_RX_DLY_SR_DEPTH) zero delay will be applied to the rxd sample.

## 14.17 UART Interface Registers

There are six UART Interface registers:-

- UART\_0 Registers
- UART\_1 Registers
- UART\_2 Registers
- UART\_3 Registers
- UART\_4 Registers
- UART\_5 Registers

UART Interface Registers	Address Offset	Table
UART_0	48200000h - 482000FCh	Table 13-30
UART_1	48202000h - 482020FCh	Table 13-31
UART_2	48204000h - 482040FCh	Table 13-32
UART_3	48206000h - 482060FCh	Table 13-33
UART_4	48208000h - 482080FCh	Table 13-34
UART_5	4820A000h - 4820A0FCh	Table 13-35

## 14.17.1 UART\_0 Registers Summary

**Table 14-30. Summary of UART\_0 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48200000h	4	RBR	00000000h
48200004h	4	IER	00000000h

### 14.17.1.1 RBR — Offset 48200000h

Receive Buffer Register - Receive Buffer Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48200000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8:0	000h RO/V	<b>RBR:</b> Receive Buffer Register. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to 0), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an over-run error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to 1), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost and an over-run error occurs. Note: When UART_9BIT_DATA_EN=0, this field width is 8. When UART_9BIT_DATA_EN=1, this field width is 9.

#### 14.17.1.2 IER — Offset 48200004h

Interrupt Enable Register - Interrupt Enable Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48200004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>PTIME:</b> Programmable THRE Interrupt Mode Enable. Writeable only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt.
6:5	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>ELCOLR:</b> Interrupt Enable Register: ELCOLR, this bit controls the method for clearing the status in the LSR register. This is applicable only for Overrun Error, Parity Error, Framing Error, and Break Interrupt status bits. 0 = LSR status bits are cleared either on reading Rx FIFO (RBR Read) or On reading LSR register. 1 = LSR status bits are cleared only on reading LSR register. Writeable only when LSR_STATUS_CLEAR == Enabled, always readable.
3	0h RW	<b>EDSSI:</b> Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt.
2	0h RW	<b>ELSI:</b> Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt.
1	0h RW	<b>ETBEI:</b> Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt.
0	0h RW	<b>ERBFI:</b> Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFO's enabled). These are the second highest priority interrupts.

### 14.17.1.3 IIR — Offset 48200008h

Interrupt Identification Register - Interrupt Identification Register

Type	Size	Offset	Default
MMIO	32 bit	48200008h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:6	0h RO/V	<b>FIFOE:</b> FIFOs Enabled (or FIFOE). This is used to indicate whether the FIFOs are enabled or disabled.
5:4	0h RO	<b>Reserved</b>
3:0	1h RO/V	<b>IID:</b> Interrupt ID (or IID). This indicates the highest priority pending interrupt which can be one of the following types specified in Values. For information on several levels into which the interrupt priorities are split into, see the 'Interrupts' section in the DW_apb_uart Databook. Note: an interrupt of type 0111 (busy detect) will never get indicated if UART_16550_COMPATIBLE == YES in coreConsultant. Bit 3 indicates an interrupt can only occur when the FIFOs are enabled and used to distinguish a Character Timeout condition interrupt.

#### 14.17.1.4 LCR — Offset 4820000Ch

Line Control Register - Line Control Register

Type	Size	Offset	Default
MMIO	32 bit	4820000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>DLAB:</b> Divisor Latch Access Bit. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH/LPDLH and LPDLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers.
6	0h RW	<b>BC:</b> Break Control Bit. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.
5	0h RW	<b>SP:</b> Stick Parity. If UART_16550_COMPATIBLE = NO, then writeable only when UART is not busy (USR[0] is 0); otherwise always writable and always readable. This bit is used to force parity value. When PEN, EPS and Stick Parity are set to 1, the parity bit is transmitted and checked as logic 0. If PEN and Stick Parity are set to 1 and EPS is a logic 0, then parity bit is transmitted and checked as a logic 1. If this bit is set to 0, Stick Parity is disabled.
4	0h RW	<b>EPS:</b> Even Parity Select. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic '1's is transmitted or checked. If set to zero, an odd number of logic '1's is transmitted or checked.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	<b>PEN:</b> Parity Enable . If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively.
2	0h RW	<b>STOP:</b> Number of stop bits. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select the number of stop bits per character that the peripheral will transmit and receive. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected the receiver will only check the first stop bit. Note: NOTE: The STOP bit duration implemented by DW_apb_uart may appear longer due to idle time inserted between characters for some configurations and baud clock divisor values in the transmit direction; for details on idle time between transmitted transfers, refer to 'Back-to-Back Character Stream Transmission' section in data book.
1:0	0h RW	<b>DLS:</b> Data Length Select (or CLS as used in legacy). If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. When DLS_E in LCR_EXT is set to 0, this register is used to select the number of data bits per character that the peripheral will transmit and receive.

#### 14.17.1.5 MCR — Offset 48200010h

Modem Control Register - Modem Control Register

Type	Size	Offset	Default
MMIO	32 bit	48200010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>SIRE:</b> SIR Mode Enable . Writeable only when SIR_MODE == Enabled, always readable. This is used to enable/ disable the IrDA SIR Mode features as described in section 'IrDA 1.0 SIR Protocol' in the databook. Note: To enable SIR mode, write the appropriate value to the MCR register before writing to the LCR register. For details of the recommended programming sequence, refer to 'Programing Examples' section of data book.
5	0h RW	<b>AFCE:</b> Auto Flow Control Enable . Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in section 'Auto Flow Control' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>LOOPBACK:</b> LoopBack Bit . This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled OR NOT active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.
3	0h RW	<b>OUT2:</b> OUT2 . This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n. Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.
2	0h RW	<b>OUT1:</b> OUT1 . This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n. Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.
1	0h RW	<b>RTS:</b> Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFO's enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal will be de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input.
0	0h RW	<b>DTR:</b> Data Terminal Ready. This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n. The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input.

#### 14.17.1.6 LSR — Offset 48200014h

Line Status Register - Line Status Register

Type	Size	Offset	Default
MMIO	32 bit	48200014h	00000060h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RO/V	<b>ADDR_RCVD:</b> Address Received Bit. If 9Bit data mode (LCR_EXT[0]=1) is enabled, this bit is used to indicate the 9th bit of the receive data is set to 1. This bit can also be used to indicate whether the incoming character is address or data. - 1 = Indicates the character is address. - 0 = Indicates the character is data. In the FIFO mode, since the 9th bit is associated with a character received, it is revealed when the character with the 9th bit set to 1 is at the top of the FIFO. Reading the LSR clears the 9BIT. Note: User needs to ensure that interrupt gets cleared (reading LSR register) before the next address byte arrives. If there is a delay in clearing the interrupt, then Software will not be able to distinguish between multiple address related interrupt.
7	0h RO/V	<b>RFE:</b> Receiver FIFO Error bit. This bit is only relevant when FIFO_MODE != NONE AND FIFO's are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1h RO/V	<b>TEM:</b> Transmitter Empty bit. If in FIFO mode (FIFO_MODE != NONE) and FIFO's enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in the non-FIFO mode or FIFO's are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.
5	1h RO/V	<b>THRE:</b> Transmit Holding Register Empty bit. If THRE_MODE_USER = Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Programmable THRE interrupt mode operation is described in detail in section 'Programmable THRE Interrupt' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>BI:</b> Break Interrupt bit. This is used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the BI bit (if LSR_STATUS_CLEAR==0). In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. Note: If a FIFO is full when a break condition is received, a FIFO overrun occurs. The break condition and all the information associated with it-parity and framing errors-is discarded; any information that a break character was received is lost.
3	0h RO/V	<b>FE:</b> Framing Error bit. This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs the UART will try resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). This happens because the break character implicitly generates a framing error by holding the sin input to logic 0 for longer than the duration of a character. Reading the LSR clears the FE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the FE bit (if LSR_STATUS_CLEAR==0).
2	0h RO/V	<b>PE:</b> Parity Error bit. This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). In this situation, the Parity Error bit is set if parity generation and detection is enabled (LCR[3]=1) and the parity is set to odd (LCR[4]=0). Reading the LSR clears the PE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the PE bit (if LSR_STATUS_CLEAR==0).
1	0h RO/V	<b>OE:</b> Overrun error bit. This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. Reading the LSR clears the OE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the OE bit (if LSR_STATUS_CLEAR==0).
0	0h RO/V	<b>DR:</b> Data Ready bit. This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. This bit is cleared when the RBR is read in the non-FIFO mode, or when the receiver FIFO is empty, in the FIFO mode.

#### 14.17.1.7 MSR – Offset 48200018h

Modem Status Register - Whenever bits 0, 1, 2 or 3 is set to logic one, to indicate a change on the modem control inputs, a modem status interrupt will be generated if enabled via the IER regardless of when the change occurred. The bits (bits 0, 1, 3) can be set after a reset-even though their respective modem signals are inactive-because

the synchronized version of the modem signals have a reset value of 0 and change to value 1 after reset. To prevent unwanted interrupts due to this change, a read of the MSR register can be performed after reset.

Type	Size	Offset	Default
MMIO	32 bit	48200018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RO/V	<b>DCD:</b> Data Carrier Detect. This is used to indicate the current state of the modem control line dcd_n. That is this bit is the complement dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2).
6	0h RO/V	<b>RI:</b> Ring Indicator. This is used to indicate the current state of the modem control line ri_n. That is this bit is the complement ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1).
5	0h RO/V	<b>DSR:</b> Data Set Ready. This is used to indicate the current state of the modem control line dsr_n. That is this bit is the complement dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR).
4	0h RO/V	<b>CTS:</b> Clear to Send. This is used to indicate the current state of the modem control line cts_n. That is, this bit is the complement cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), CTS is the same as MCR[1] (RTS).
3	0h RO/V	<b>DDCD:</b> Delta Data Carrier Detect. This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] set to one), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit will get set when the reset is removed if the dcd_n signal remains asserted.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO/V	<b>TERI:</b> Trailing Edge of Ring Indicator. This is used to indicate that a change on the input ri_n (from an active low, to an inactive high state) has occurred since the last time the MSR was read. Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] set to one), TERI reflects when MCR[2] (Out1) has changed state from a high to a low.
1	0h RO/V	<b>DDSR:</b> Delta Data Set Ready. This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] set to one), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit will get set when the reset is removed if the dsr_n signal remains asserted.
0	0h RO/V	<b>DCTS:</b> Delta Clear to Send. This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] set to one), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit will get set when the reset is removed if the cts_n signal remains asserted.

#### 14.17.1.8 SCR — Offset 4820001Ch

Scratchpad Register - Scratchpad Register

Type	Size	Offset	Default
MMIO	32 bit	4820001Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>SCR:</b> This register is for programmers to use as a temporary storage space. It has no defined purpose in the DW_apb_uart.

#### 14.17.1.9 FAR — Offset 48200070h

FIFO Access Register - FIFO Access Register

Type	Size	Offset	Default
MMIO	32 bit	48200070h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>FAR:</b> Writes will have no effect when FIFO_ACCESS == No, always readable. This register is used to enable a FIFO access mode for testing, so that the receive FIFO can be written by the master and the transmit FIFO can be read by the master when FIFO's are implemented and enabled. When FIFOs are not implemented or not enabled it allows the RBR to be written by the master and the THR to be read by the master. Note, that when the FIFO access mode is enabled/disabled, the control portion of the receive FIFO and transmit FIFO is reset and the FIFO's are treated as empty.

#### 14.17.1.10 USR — Offset 4820007Ch

UART Status register - UART Status register.

Type	Size	Offset	Default
MMIO	32 bit	4820007Ch	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO is completely full. That is: This bit is cleared when the RX FIFO is no longer full.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO contains one or more entries. This bit is cleared when the RX FIFO is empty.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is completely empty. This bit is cleared when the TX FIFO is no longer empty.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is not full. This bit is cleared when the TX FIFO is full.
0	0h RO	<b>Reserved</b>

#### 14.17.1.11 TFL — Offset 48200080h

Transmit FIFO Level - TFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48200080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TFL:</b> Transmit FIFO Level. This indicates the number of data entries in the transmit FIFO.

#### 14.17.1.12 RFL — Offset 48200084h

Receive FIFO Level - RFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48200084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RFL:</b> Receive FIFO Level. This indicates the number of data entries in the receive FIFO.

#### 14.17.1.13 HTX — Offset 482000A4h

Halt TX - Halt TX

Type	Size	Offset	Default
MMIO	32 bit	482000A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>HTX:</b> Halt TX. Writes will have no effect when FIFO_MODE == NONE, always readable. This register is use to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFO's are implemented and enabled. Note, if FIFO's are implemented and not enabled the setting of the halt TX register will have no effect on operation.

#### 14.17.1.14 DMASA — Offset 482000A8h

DMA Software Acknowledge Register - DMA Software Acknowledge Register

Type	Size	Offset	Default
MMIO	32 bit	482000A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h WO	<b>DMASA:</b> DMA Software Acknowledge. Writes will have no effect when DMA_EXTRA == No. This register is use to perform DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This will cause the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing' and it is not necessary to clear this bit.

#### 14.17.1.15 TCR – Offset 482000ACh

Transceiver Control Register - This register is used to enable or disable RS485 mode and also control the polarity values for Driven enable (de) and Receiver Enable (re) signals. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	482000ACh	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:3	0h RW	<b>XFER_MODE:</b> Transfer Mode. - 0: In this mode, transmit and receive can happen simultaneously. The user can enable DE_EN, RE_EN at any point of time. Turn around timing as programmed in the TAT register is not applicable in this mode. - 1: In this mode, DE and RE are mutually exclusive. Either DE or RE only one of them is expected to be enabled through programming. Hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. For transmission Hardware will wait if it is in middle of receiving any transfer, before it starts transmitting. - 2: In this mode, DE and RE are mutually exclusive. Once DE_EN/RE_EN is programmed - by default 're' will be enabled and DW_apb_uart controller will be ready to receive. If the user programs the TX FIFO with the data then DW_apb_uart, after ensuring no receive is in progress, disable 're' and enable 'de' signal. Once the TX FIFO becomes empty, 're' signal gets enabled and 'de' signal will be disabled. In this mode of operation hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. In this mode, 'de' and 're' signals are strictly complementary to each other.
2	1h RW	<b>DE_POL:</b> Driver Enable Polarity. - 1: DE signal is active high - 0: DE signal is active low
1	1h RW	<b>RE_POL:</b> Receiver Enable Polarity. - 1: RE signal is active high - 0: RE signal is active low
0	0h RW	<b>RS485_EN:</b> RS485 Transfer Enable. - 0 : In this mode, the transfers are still in the RS232 mode. All other fields in this register are reserved and register DE_EN/RE_EN/TAT are also reserved. - 1 : In this mode, the transfers will happen in RS485 mode. All other fields of this register are applicable.

#### 14.17.1.16 DE\_EN – Offset 482000B0h

Driver Output Enable Register - The Driver Output Enable Register (DE\_EN) is used to control the assertion and de-assertion of the DE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482000B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>DE_ENABLE:</b> DE Enable control. The 'DE Enable' register bit is used to control assertion and de-assertion of 'de' signal. - 0: De-assert 'de' signal - 1: Assert 'de' signal

#### 14.17.1.17 RE\_EN — Offset 482000B4h

Receiver Output Enable Register - The Receiver Output Enable Register (RE\_EN) is used to control the assertion and de-assertion of the RE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If the RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482000B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>RE_ENABLE:</b> RE Enable control. The 'RE Enable' register bit is used to control assertion and de-assertion of 're' signal. - 0: De-assert 're' signal - 1: Assert 're' signal

#### 14.17.1.18 DET — Offset 482000B8h

Driver Output Enable Timing Register - The Driver Output Enable Timing Register (DET) is used to control the DE assertion and de-assertion timings of 'de' signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482000B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	00h RW	<b>DE_DE_ASSERTION_TIME:</b> Driver Enable de-assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the end of stop bit on the sout to the falling edge of Driver output enable signal.
15:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>DE_ASSERTION_TIME:</b> Driver Enable assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the assertion of rising edge of Driver output enable signal to serial transmit enable. Any data in transmit buffer, will start on serial output (sout) after the transmit enable.

#### 14.17.1.19 TAT — Offset 482000BCh

TurnAround Timing Register - The TurnAround Timing Register (TAT) is used to hold the turnaround time between switching of 're' and 'de' signals. This register is only valid when the DW\_apb\_uart is configured to have the RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482000BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>RE_TO_DE:</b> Receiver Enable to Driver Enable TurnAround time. Turnaround time (in terms of serial clock) for RE De-assertion to DE assertion. Note: - If the DE assertion time in the DET register is 0, then the actual value is the programmed value + 3. - If the DE assertion time in the DET register is 1, then the actual value is the programmed value + 2. - If the DE assertion time in the DET register is greater than 1, then the actual value is the programmed value + 1.
15:0	0000h RW	<b>DE_TO_RE:</b> Driver Enable to Receiver Enable TurnAround time. Turnaround time (in terms of serial clock) for DE De-assertion to RE assertion. Note: The actual time is the programmed value + 1.

#### 14.17.1.20 DLF – Offset 482000C0h

Divisor Latch Fraction Register - This register is only valid when the DW\_apb\_uart is configured to have Fractional Baud rate Divisor implemented (FRACTIONAL\_BAUD\_DIVISOR\_EN = ENABLED). If Fractional Baud rate divisor is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482000C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>DLF:</b> Fractional part of divisor. The fractional value is added to integer value set by DLH, DLL. Fractional value is determined by (Divisor Fraction value)/(2^DLF_SIZE). For information on DLF values to be programmed for DLF_SIZE=4, see the 'Fractional Baud Rate Support' section in the DW_apb_uart Databook.

#### 14.17.1.21 RAR – Offset 482000C4h

Receive Address Register - Receive Address Register

Type	Size	Offset	Default
MMIO	32 bit	482000C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RAR:</b> This is an address matching register during receive mode. If the 9-th bit is set in the incoming character then the remaining 8-bits will be checked against this register value. If the match happens then sub-sequent characters with 9-th bit set to 0 will be treated as data byte until the next address byte is received. Note: - This register is applicable only when 'ADDR_MATCH'(LCR_EXT[1] and 'DLS_E' (LCR_EXT[0]) bits are set to 1. - If UART_16550_COMPATIBLE is configured to 0, then RAR should be programmed only when UART is not busy. - If UART_16550_COMPATIBLE is configured to 0, then RAR can be programmed at any point of the time. However, user must not change this register value when any receive is in progress.

#### 14.17.1.22 TAR — Offset 482000C8h

Transmit Address Register - Transmit Address Register

Type	Size	Offset	Default
MMIO	32 bit	482000C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>TAR:</b> This is an address matching register during transmit mode. If DLS_E (LCR_EXT[0]) bit is enabled, then DW_apb_uart will send the 9-bit character with 9-th bit set to 1 and remaining 8-bit address will be sent from this register provided 'SEND_ADDR' (LCR_EXT[2]) bit is set to 1. Note: - This register is used only to send the address. The normal data should be sent by programming THR register. - Once the address is started to send on the DW_apb_uart serial lane, then 'SEND_ADDR' bit will be auto-cleared by the hardware.

#### 14.17.1.23 LCR\_EXT — Offset 482000CCh

Line Extended Control Register - Line Extended Control Register

Type	Size	Offset	Default
MMIO	32 bit	482000CCh	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW/V	<b>TRANSMIT_MODE:</b> Transmit mode control bit. This bit is used to control the type of transmit mode during 9-bit data transfers. - 1: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding Register (STHR) are 9-bit wide. The user needs to ensure that the THR/STHR register is written correctly for address/data. Address: 9th bit is set to 1, Data : 9th bit is set to 0. Note: Transmit address register (TAR) is not applicable in this mode of operation. - 0: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding register (STHR) are 8-bit wide. The user needs to program the address into Transmit Address Register (TAR) and data into the THR/STHR register. SEND_ADDR bit is used as a control knob to indicate the DW_apb_uart on when to send the address.
2	0h RW/V	<b>SEND_ADDR:</b> Send address control bit. This bit is used as a control knob for the user to determine when to send the address during transmit mode. - 1 = 9-bit character will be transmitted with 9-th bit set to 1 and the remaining 8-bits will match to what is being programmed in 'Transmit Address Register'. - 0 = 9-bit character will be transmitted with 9-th bit set to 0 and the remaining 8-bits will be taken from the TXFIFO which is programmed through 8-bit wide THR/STHR register. Note: - 1. This bit is auto-cleared by the hardware, after sending out the address character. User is not expected to program this bit to 0. - 2. This field is applicable only when DLS_E bit is set to 1 and TRANSMIT_MODE is set to 0.
1	0h RW/V	<b>ADDR_MATCH:</b> Address Match Mode. This bit is used to enable the address match feature during receive. - 1 = Address match mode; DW_apb_uart will wait until the incoming character with 9-th bit set to 1. And further checks to see if the address matches with what is programmed in 'Receive Address Match Register'. If match is found, then subsequent characters will be treated as valid data and DW_apb_uart starts receiving data. - 0 = Normal mode; DW_apb_uart will start to receive the data and 9-bit character will be formed and written into the receive RXFIFO. User is responsible to read the data and differentiate b/n address and data. Note: This field is applicable only when DLS_E is set to 1.
0	0h RW/V	<b>DLS_E:</b> Extension for DLS. This bit is used to enable 9-bit data for transmit and receive transfers.

#### 14.17.1.24 CPR – Offset 482000F4h

Component Parameter Register - Component Parameter Register. This register is valid only when UART\_ADD\_ENCODED\_PARAMS = 1. If the UART\_ADD\_ENCODED\_PARAMS parameter is not set, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482000F4h	00043532h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	04h RO/V	<b>FIFO_MODE:</b> Encoding of FIFO_MODE configuration parameter value.
15:14	0h RO	<b>Reserved</b>
13	1h RO/V	<b>DMA_EXTRA:</b> Encoding of DMA_EXTRA configuration parameter value.
12	1h RO/V	<b>UART_ADD_ENCODED_PARAMS:</b> Encoding of UART_ADD_ENCODED_PARAMS configuration parameter value.
11	0h RO/V	<b>SHADOW:</b> Encoding of SHADOW configuration parameter value.
10	1h RO/V	<b>FIFO_STAT:</b> Encoding of FIFO_STAT configuration parameter value.
9	0h RO/V	<b>FIFO_ACCESS:</b> Encoding of FIFO_ACCESS configuration parameter value.
8	1h RO/V	<b>ADDITIONAL_FEAT:</b> Encoding of ADDITIONAL_FEATURES configuration parameter value.
7	0h RO/V	<b>SIR_LP_MODE:</b> Encoding of SIR_LP_MODE configuration parameter value.
6	0h RO/V	<b>SIR_MODE:</b> Encoding of SIR_MODE configuration parameter value.
5	1h RO/V	<b>THRE_MODE:</b> Encoding of THRE_MODE configuration parameter value.
4	1h RO/V	<b>AFCE_MODE:</b> Encoding of AFCE_MODE configuration parameter value.
3:2	0h RO	<b>Reserved</b>
1:0	2h RO/V	<b>APB_DATA_WIDTH:</b> Encoding of APB_DATA_WIDTH configuration parameter value.

#### 14.17.1.25 UCV – Offset 482000F8h

UART Component Version - UCV register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482000F8h	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>UART_COMPONENT_VERSION:</b> ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*

#### 14.17.1.26 CTR – Offset 482000FCh

Component Type Register - CTR is register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482000FCh	44570110h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570110h RO/V	<b>PERIPHERAL_ID:</b> This register contains the peripherals identification code.

## 14.17.2 UART\_1 Registers Summary

**Table 14-31. Summary of UART\_1 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48202000h	4	RBR	00000000h
48202004h	4	IER	00000000h
48202008h	4	IIR	00000001h
4820200Ch	4	LCR	00000000h
48202010h	4	MCR	00000000h
48202014h	4	LSR	00000060h
48202018h	4	MSR	00000000h
4820201Ch	4	SCR	00000000h
48202070h	4	FAR	00000000h
4820207Ch	4	USR	00000006h
48202080h	4	TFI	00000000h
48202084h	4	RFL	00000000h

### 14.17.2.1 RBR — Offset 48202000h

Receive Buffer Register - Receive Buffer Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48202000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8:0	000h RO/V	<b>RBR:</b> Receive Buffer Register. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to 0), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an over-run error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to 1), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost and an over-run error occurs. Note: When UART_9BIT_DATA_EN=0, this field width is 8. When UART_9BIT_DATA_EN=1, this field width is 9.

#### 14.17.2.2 IER — Offset 48202004h

Interrupt Enable Register - Interrupt Enable Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48202004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>PTIME:</b> Programmable THRE Interrupt Mode Enable. Writeable only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt.
6:5	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>ELCOLR:</b> Interrupt Enable Register: ELCOLR, this bit controls the method for clearing the status in the LSR register. This is applicable only for Overrun Error, Parity Error, Framing Error, and Break Interrupt status bits. 0 = LSR status bits are cleared either on reading Rx FIFO (RBR Read) or On reading LSR register. 1 = LSR status bits are cleared only on reading LSR register. Writeable only when LSR_STATUS_CLEAR == Enabled, always readable.
3	0h RW	<b>EDSSI:</b> Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt.
2	0h RW	<b>ELSI:</b> Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt.
1	0h RW	<b>ETBEI:</b> Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt.
0	0h RW	<b>ERBFI:</b> Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFO's enabled). These are the second highest priority interrupts.

### 14.17.2.3 IIR — Offset 48202008h

Interrupt Identification Register - Interrupt Identification Register

Type	Size	Offset	Default
MMIO	32 bit	48202008h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:6	0h RO/V	<b>FIFOE:</b> FIFOs Enabled (or FIFOE). This is used to indicate whether the FIFOs are enabled or disabled.
5:4	0h RO	<b>Reserved</b>
3:0	1h RO/V	<b>IID:</b> Interrupt ID (or IID). This indicates the highest priority pending interrupt which can be one of the following types specified in Values. For information on several levels into which the interrupt priorities are split into, see the 'Interrupts' section in the DW_apb_uart Databook. Note: an interrupt of type 0111 (busy detect) will never get indicated if UART_16550_COMPATIBLE == YES in coreConsultant. Bit 3 indicates an interrupt can only occur when the FIFOs are enabled and used to distinguish a Character Timeout condition interrupt.

#### 14.17.2.4 LCR — Offset 4820200Ch

Line Control Register - Line Control Register

Type	Size	Offset	Default
MMIO	32 bit	4820200Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>DLAB:</b> Divisor Latch Access Bit. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH/LPDLH and LPDLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers.
6	0h RW	<b>BC:</b> Break Control Bit. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.
5	0h RW	<b>SP:</b> Stick Parity. If UART_16550_COMPATIBLE = NO, then writeable only when UART is not busy (USR[0] is 0); otherwise always writable and always readable. This bit is used to force parity value. When PEN, EPS and Stick Parity are set to 1, the parity bit is transmitted and checked as logic 0. If PEN and Stick Parity are set to 1 and EPS is a logic 0, then parity bit is transmitted and checked as a logic 1. If this bit is set to 0, Stick Parity is disabled.
4	0h RW	<b>EPS:</b> Even Parity Select. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic '1's is transmitted or checked. If set to zero, an odd number of logic '1's is transmitted or checked.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	<b>PEN:</b> Parity Enable . If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively.
2	0h RW	<b>STOP:</b> Number of stop bits. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select the number of stop bits per character that the peripheral will transmit and receive. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected the receiver will only check the first stop bit. Note: NOTE: The STOP bit duration implemented by DW_apb_uart may appear longer due to idle time inserted between characters for some configurations and baud clock divisor values in the transmit direction; for details on idle time between transmitted transfers, refer to 'Back-to-Back Character Stream Transmission' section in data book.
1:0	0h RW	<b>DLS:</b> Data Length Select (or CLS as used in legacy). If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. When DLS_E in LCR_EXT is set to 0, this register is used to select the number of data bits per character that the peripheral will transmit and receive.

#### 14.17.2.5 MCR — Offset 48202010h

Modem Control Register - Modem Control Register

Type	Size	Offset	Default
MMIO	32 bit	48202010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>SIRE:</b> SIR Mode Enable . Writeable only when SIR_MODE == Enabled, always readable. This is used to enable/ disable the IrDA SIR Mode features as described in section 'IrDA 1.0 SIR Protocol' in the databook. Note: To enable SIR mode, write the appropriate value to the MCR register before writing to the LCR register. For details of the recommended programming sequence, refer to 'Programing Examples' section of data book.
5	0h RW	<b>AFCE:</b> Auto Flow Control Enable . Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in section 'Auto Flow Control' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>LOOPBACK:</b> LoopBack Bit . This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled OR NOT active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.
3	0h RW	<b>OUT2:</b> OUT2 . This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n. Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.
2	0h RW	<b>OUT1:</b> OUT1 . This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n. Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.
1	0h RW	<b>RTS:</b> Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFO's enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal will be de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input.
0	0h RW	<b>DTR:</b> Data Terminal Ready. This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n. The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input.

#### 14.17.2.6 LSR — Offset 48202014h

Line Status Register - Line Status Register

Type	Size	Offset	Default
MMIO	32 bit	48202014h	00000060h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RO/V	<b>ADDR_RCVD:</b> Address Received Bit. If 9Bit data mode (LCR_EXT[0]=1) is enabled, this bit is used to indicate the 9th bit of the receive data is set to 1. This bit can also be used to indicate whether the incoming character is address or data. - 1 = Indicates the character is address. - 0 = Indicates the character is data. In the FIFO mode, since the 9th bit is associated with a character received, it is revealed when the character with the 9th bit set to 1 is at the top of the FIFO. Reading the LSR clears the 9BIT. Note: User needs to ensure that interrupt gets cleared (reading LSR register) before the next address byte arrives. If there is a delay in clearing the interrupt, then Software will not be able to distinguish between multiple address related interrupt.
7	0h RO/V	<b>RFE:</b> Receiver FIFO Error bit. This bit is only relevant when FIFO_MODE != NONE AND FIFO's are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1h RO/V	<b>TEM:</b> Transmitter Empty bit. If in FIFO mode (FIFO_MODE != NONE) and FIFO's enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in the non-FIFO mode or FIFO's are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.
5	1h RO/V	<b>THRE:</b> Transmit Holding Register Empty bit. If THRE_MODE_USER = Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Programmable THRE interrupt mode operation is described in detail in section 'Programmable THRE Interrupt' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>BI:</b> Break Interrupt bit. This is used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the BI bit (if LSR_STATUS_CLEAR==0). In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. Note: If a FIFO is full when a break condition is received, a FIFO overrun occurs. The break condition and all the information associated with it-parity and framing errors-is discarded; any information that a break character was received is lost.
3	0h RO/V	<b>FE:</b> Framing Error bit. This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs the UART will try resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). This happens because the break character implicitly generates a framing error by holding the sin input to logic 0 for longer than the duration of a character. Reading the LSR clears the FE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the FE bit (if LSR_STATUS_CLEAR==0).
2	0h RO/V	<b>PE:</b> Parity Error bit. This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). In this situation, the Parity Error bit is set if parity generation and detection is enabled (LCR[3]=1) and the parity is set to odd (LCR[4]=0). Reading the LSR clears the PE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the PE bit (if LSR_STATUS_CLEAR==0).
1	0h RO/V	<b>OE:</b> Overrun error bit. This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. Reading the LSR clears the OE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the OE bit (if LSR_STATUS_CLEAR==0).
0	0h RO/V	<b>DR:</b> Data Ready bit. This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. This bit is cleared when the RBR is read in the non-FIFO mode, or when the receiver FIFO is empty, in the FIFO mode.

#### 14.17.2.7 MSR – Offset 48202018h

Modem Status Register - Whenever bits 0, 1, 2 or 3 is set to logic one, to indicate a change on the modem control inputs, a modem status interrupt will be generated if enabled via the IER regardless of when the change occurred. The bits (bits 0, 1, 3) can be set after a reset-even though their respective modem signals are inactive-because

the synchronized version of the modem signals have a reset value of 0 and change to value 1 after reset. To prevent unwanted interrupts due to this change, a read of the MSR register can be performed after reset.

Type	Size	Offset	Default
MMIO	32 bit	48202018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RO/V	<b>DCD:</b> Data Carrier Detect. This is used to indicate the current state of the modem control line dcd_n. That is this bit is the complement dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2).
6	0h RO/V	<b>RI:</b> Ring Indicator. This is used to indicate the current state of the modem control line ri_n. That is this bit is the complement ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1).
5	0h RO/V	<b>DSR:</b> Data Set Ready. This is used to indicate the current state of the modem control line dsr_n. That is this bit is the complement dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR).
4	0h RO/V	<b>CTS:</b> Clear to Send. This is used to indicate the current state of the modem control line cts_n. That is, this bit is the complement cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), CTS is the same as MCR[1] (RTS).
3	0h RO/V	<b>DDCD:</b> Delta Data Carrier Detect. This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] set to one), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit will get set when the reset is removed if the dcd_n signal remains asserted.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO/V	<b>TERI:</b> Trailing Edge of Ring Indicator. This is used to indicate that a change on the input ri_n (from an active low, to an inactive high state) has occurred since the last time the MSR was read. Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] set to one), TERI reflects when MCR[2] (Out1) has changed state from a high to a low.
1	0h RO/V	<b>DDSR:</b> Delta Data Set Ready. This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] set to one), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit will get set when the reset is removed if the dsr_n signal remains asserted.
0	0h RO/V	<b>DCTS:</b> Delta Clear to Send. This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] set to one), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit will get set when the reset is removed if the cts_n signal remains asserted.

#### 14.17.2.8 SCR — Offset 4820201Ch

Scratchpad Register - Scratchpad Register

Type	Size	Offset	Default
MMIO	32 bit	4820201Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>SCR:</b> This register is for programmers to use as a temporary storage space. It has no defined purpose in the DW_apb_uart.

#### 14.17.2.9 FAR — Offset 48202070h

FIFO Access Register - FIFO Access Register

Type	Size	Offset	Default
MMIO	32 bit	48202070h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>FAR:</b> Writes will have no effect when FIFO_ACCESS == No, always readable. This register is used to enable a FIFO access mode for testing, so that the receive FIFO can be written by the master and the transmit FIFO can be read by the master when FIFO's are implemented and enabled. When FIFOs are not implemented or not enabled it allows the RBR to be written by the master and the THR to be read by the master. Note, that when the FIFO access mode is enabled/disabled, the control portion of the receive FIFO and transmit FIFO is reset and the FIFO's are treated as empty.

#### 14.17.2.10 USR — Offset 4820207Ch

UART Status register - UART Status register.

Type	Size	Offset	Default
MMIO	32 bit	4820207Ch	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO is completely full. That is: This bit is cleared when the RX FIFO is no longer full.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO contains one or more entries. This bit is cleared when the RX FIFO is empty.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is completely empty. This bit is cleared when the TX FIFO is no longer empty.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is not full. This bit is cleared when the TX FIFO is full.
0	0h RO	<b>Reserved</b>

#### 14.17.2.11 TFL — Offset 48202080h

Transmit FIFO Level - TFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48202080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TFL:</b> Transmit FIFO Level. This indicates the number of data entries in the transmit FIFO.

#### 14.17.2.12 RFL — Offset 48202084h

Receive FIFO Level - RFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48202084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RFL:</b> Receive FIFO Level. This indicates the number of data entries in the receive FIFO.

#### 14.17.2.13 HTX — Offset 482020A4h

Halt TX - Halt TX

Type	Size	Offset	Default
MMIO	32 bit	482020A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>HTX:</b> Halt TX. Writes will have no effect when FIFO_MODE == NONE, always readable. This register is use to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFO's are implemented and enabled. Note, if FIFO's are implemented and not enabled the setting of the halt TX register will have no effect on operation.

#### 14.17.2.14 DMASA — Offset 482020A8h

DMA Software Acknowledge Register - DMA Software Acknowledge Register

Type	Size	Offset	Default
MMIO	32 bit	482020A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h WO	<b>DMASA:</b> DMA Software Acknowledge. Writes will have no effect when DMA_EXTRA == No. This register is use to perform DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This will cause the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing' and it is not necessary to clear this bit.

#### 14.17.2.15 TCR – Offset 482020ACh

Transceiver Control Register - This register is used to enable or disable RS485 mode and also control the polarity values for Driven enable (de) and Receiver Enable (re) signals. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	482020ACh	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:3	0h RW	<b>XFER_MODE:</b> Transfer Mode. - 0: In this mode, transmit and receive can happen simultaneously. The user can enable DE_EN, RE_EN at any point of time. Turn around timing as programmed in the TAT register is not applicable in this mode. - 1: In this mode, DE and RE are mutually exclusive. Either DE or RE only one of them is expected to be enabled through programming. Hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. For transmission Hardware will wait if it is in middle of receiving any transfer, before it starts transmitting. - 2: In this mode, DE and RE are mutually exclusive. Once DE_EN/RE_EN is programmed - by default 're' will be enabled and DW_apb_uart controller will be ready to receive. If the user programs the TX FIFO with the data then DW_apb_uart, after ensuring no receive is in progress, disable 're' and enable 'de' signal. Once the TX FIFO becomes empty, 're' signal gets enabled and 'de' signal will be disabled. In this mode of operation hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. In this mode, 'de' and 're' signals are strictly complementary to each other.
2	1h RW	<b>DE_POL:</b> Driver Enable Polarity. - 1: DE signal is active high - 0: DE signal is active low
1	1h RW	<b>RE_POL:</b> Receiver Enable Polarity. - 1: RE signal is active high - 0: RE signal is active low
0	0h RW	<b>RS485_EN:</b> RS485 Transfer Enable. - 0 : In this mode, the transfers are still in the RS232 mode. All other fields in this register are reserved and register DE_EN/RE_EN/TAT are also reserved. - 1 : In this mode, the transfers will happen in RS485 mode. All other fields of this register are applicable.

#### 14.17.2.16 DE\_EN – Offset 482020B0h

Driver Output Enable Register - The Driver Output Enable Register (DE\_EN) is used to control the assertion and de-assertion of the DE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482020B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>DE_ENABLE:</b> DE Enable control. The 'DE Enable' register bit is used to control assertion and de-assertion of 'de' signal. - 0: De-assert 'de' signal - 1: Assert 'de' signal

#### 14.17.2.17 RE\_EN — Offset 482020B4h

Receiver Output Enable Register - The Receiver Output Enable Register (RE\_EN) is used to control the assertion and de-assertion of the RE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If the RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482020B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>RE_ENABLE:</b> RE Enable control. The 'RE Enable' register bit is used to control assertion and de-assertion of 're' signal. - 0: De-assert 're' signal - 1: Assert 're' signal

#### 14.17.2.18 DET — Offset 482020B8h

Driver Output Enable Timing Register - The Driver Output Enable Timing Register (DET) is used to control the DE assertion and de-assertion timings of 'de' signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482020B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	00h RW	<b>DE_DE_ASSERTION_TIME:</b> Driver Enable de-assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the end of stop bit on the sout to the falling edge of Driver output enable signal.
15:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>DE_ASSERTION_TIME:</b> Driver Enable assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the assertion of rising edge of Driver output enable signal to serial transmit enable. Any data in transmit buffer, will start on serial output (sout) after the transmit enable.

#### 14.17.2.19 TAT — Offset 482020BCh

TurnAround Timing Register - The TurnAround Timing Register (TAT) is used to hold the turnaround time between switching of 're' and 'de' signals. This register is only valid when the DW\_apb\_uart is configured to have the RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482020BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>RE_TO_DE:</b> Receiver Enable to Driver Enable TurnAround time. Turnaround time (in terms of serial clock) for RE De-assertion to DE assertion. Note: - If the DE assertion time in the DET register is 0, then the actual value is the programmed value + 3. - If the DE assertion time in the DET register is 1, then the actual value is the programmed value + 2. - If the DE assertion time in the DET register is greater than 1, then the actual value is the programmed value + 1.
15:0	0000h RW	<b>DE_TO_RE:</b> Driver Enable to Receiver Enable TurnAround time. Turnaround time (in terms of serial clock) for DE De-assertion to RE assertion. Note: The actual time is the programmed value + 1.

#### 14.17.2.20 DLF – Offset 482020C0h

Divisor Latch Fraction Register - This register is only valid when the DW\_apb\_uart is configured to have Fractional Baud rate Divisor implemented (FRACTIONAL\_BAUD\_DIVISOR\_EN = ENABLED). If Fractional Baud rate divisor is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482020C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>DLF:</b> Fractional part of divisor. The fractional value is added to integer value set by DLH, DLL. Fractional value is determined by (Divisor Fraction value)/(2^DLF_SIZE). For information on DLF values to be programmed for DLF_SIZE=4, see the 'Fractional Baud Rate Support' section in the DW_apb_uart Databook.

#### 14.17.2.21 RAR – Offset 482020C4h

Receive Address Register - Receive Address Register

Type	Size	Offset	Default
MMIO	32 bit	482020C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RAR:</b> This is an address matching register during receive mode. If the 9-th bit is set in the incoming character then the remaining 8-bits will be checked against this register value. If the match happens then sub-sequent characters with 9-th bit set to 0 will be treated as data byte until the next address byte is received. Note: - This register is applicable only when 'ADDR_MATCH'(LCR_EXT[1] and 'DLS_E' (LCR_EXT[0]) bits are set to 1. - If UART_16550_COMPATIBLE is configured to 0, then RAR should be programmed only when UART is not busy. - If UART_16550_COMPATIBLE is configured to 0, then RAR can be programmed at any point of the time. However, user must not change this register value when any receive is in progress.

#### 14.17.2.22 TAR — Offset 482020C8h

Transmit Address Register - Transmit Address Register

Type	Size	Offset	Default
MMIO	32 bit	482020C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>TAR:</b> This is an address matching register during transmit mode. If DLS_E (LCR_EXT[0]) bit is enabled, then DW_apb_uart will send the 9-bit character with 9-th bit set to 1 and remaining 8-bit address will be sent from this register provided 'SEND_ADDR' (LCR_EXT[2]) bit is set to 1. Note: - This register is used only to send the address. The normal data should be sent by programming THR register. - Once the address is started to send on the DW_apb_uart serial lane, then 'SEND_ADDR' bit will be auto-cleared by the hardware.

#### 14.17.2.23 LCR\_EXT — Offset 482020CCh

Line Extended Control Register - Line Extended Control Register

Type	Size	Offset	Default
MMIO	32 bit	482020CCh	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW/V	<b>TRANSMIT_MODE:</b> Transmit mode control bit. This bit is used to control the type of transmit mode during 9-bit data transfers. - 1: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding Register (STHR) are 9-bit wide. The user needs to ensure that the THR/STHR register is written correctly for address/data. Address: 9th bit is set to 1, Data : 9th bit is set to 0. Note: Transmit address register (TAR) is not applicable in this mode of operation. - 0: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding register (STHR) are 8-bit wide. The user needs to program the address into Transmit Address Register (TAR) and data into the THR/STHR register. SEND_ADDR bit is used as a control knob to indicate the DW_apb_uart on when to send the address.
2	0h RW/V	<b>SEND_ADDR:</b> Send address control bit. This bit is used as a control knob for the user to determine when to send the address during transmit mode. - 1 = 9-bit character will be transmitted with 9-th bit set to 1 and the remaining 8-bits will match to what is being programmed in 'Transmit Address Register'. - 0 = 9-bit character will be transmitted with 9-th bit set to 0 and the remaining 8-bits will be taken from the TXFIFO which is programmed through 8-bit wide THR/STHR register. Note: - 1. This bit is auto-cleared by the hardware, after sending out the address character. User is not expected to program this bit to 0. - 2. This field is applicable only when DLS_E bit is set to 1 and TRANSMIT_MODE is set to 0.
1	0h RW/V	<b>ADDR_MATCH:</b> Address Match Mode. This bit is used to enable the address match feature during receive. - 1 = Address match mode; DW_apb_uart will wait until the incoming character with 9-th bit set to 1. And further checks to see if the address matches with what is programmed in 'Receive Address Match Register'. If match is found, then subsequent characters will be treated as valid data and DW_apb_uart starts receiving data. - 0 = Normal mode; DW_apb_uart will start to receive the data and 9-bit character will be formed and written into the receive RXFIFO. User is responsible to read the data and differentiate b/n address and data. Note: This field is applicable only when DLS_E is set to 1.
0	0h RW/V	<b>DLS_E:</b> Extension for DLS. This bit is used to enable 9-bit data for transmit and receive transfers.

#### 14.17.2.24 CPR – Offset 482020F4h

Component Parameter Register - Component Parameter Register. This register is valid only when UART\_ADD\_ENCODED\_PARAMS = 1. If the UART\_ADD\_ENCODED\_PARAMS parameter is not set, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482020F4h	00043532h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	04h RO/V	<b>FIFO_MODE:</b> Encoding of FIFO_MODE configuration parameter value.
15:14	0h RO	<b>Reserved</b>
13	1h RO/V	<b>DMA_EXTRA:</b> Encoding of DMA_EXTRA configuration parameter value.
12	1h RO/V	<b>UART_ADD_ENCODED_PARAMS:</b> Encoding of UART_ADD_ENCODED_PARAMS configuration parameter value.
11	0h RO/V	<b>SHADOW:</b> Encoding of SHADOW configuration parameter value.
10	1h RO/V	<b>FIFO_STAT:</b> Encoding of FIFO_STAT configuration parameter value.
9	0h RO/V	<b>FIFO_ACCESS:</b> Encoding of FIFO_ACCESS configuration parameter value.
8	1h RO/V	<b>ADDITIONAL_FEAT:</b> Encoding of ADDITIONAL_FEATURES configuration parameter value.
7	0h RO/V	<b>SIR_LP_MODE:</b> Encoding of SIR_LP_MODE configuration parameter value.
6	0h RO/V	<b>SIR_MODE:</b> Encoding of SIR_MODE configuration parameter value.
5	1h RO/V	<b>THRE_MODE:</b> Encoding of THRE_MODE configuration parameter value.
4	1h RO/V	<b>AFCE_MODE:</b> Encoding of AFCE_MODE configuration parameter value.
3:2	0h RO	<b>Reserved</b>
1:0	2h RO/V	<b>APB_DATA_WIDTH:</b> Encoding of APB_DATA_WIDTH configuration parameter value.

#### 14.17.2.25 UCV – Offset 482020F8h

UART Component Version - UCV register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482020F8h	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>UART_COMPONENT_VERSION:</b> ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*

#### 14.17.2.26 CTR – Offset 482020FCh

Component Type Register - CTR is register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482020FCh	44570110h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570110h RO/V	<b>PERIPHERAL_ID:</b> This register contains the peripherals identification code.

### 14.17.3 UART\_2 Registers Summary

**Table 14-32. Summary of UART\_2 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48204000h	4	RBR	00000000h
48204004h	4	IER	00000000h
48204008h	4	IIR	00000001h
4820400Ch	4	LCR	00000000h
48204010h	4	MCR	00000000h
48204014h	4	LSR	00000060h
48204018h	4	MSR	00000000h
4820401Ch	4	SCR	00000000h
48204070h	4	FAR	00000000h
4820407Ch	4	USR	00000006h
48204080h	4	TFI	00000000h
48204084h	4	RFL	00000000h
482040A4h	4	HTX	00000000h
482040A8h	4	DMASA	00000000h
482040ACh	4	TCR	00000006h
482040B0h	4	DE_EN	00000000h
482040B4h	4	RE_EN	00000000h
482040B8h	4	DET	00000000h
482040BCh	4	TAT	00000000h
482040C0h	4	DLF	00000000h
482040C4h	4	RAR	00000000h
482040C8h	4	TAR	00000000h
482040CCh	4	LCR_EXT	00000000h
482040F4h	4	CPR	00043532h
482040F8h	4	UCV	3430322Ah
482040FCh	4	CTR	44570110h

#### 14.17.3.1 RBR — Offset 48204000h

Receive Buffer Register - Receive Buffer Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48204000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8:0	000h RO/V	<b>RBR:</b> Receive Buffer Register. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to 0), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an over-run error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to 1), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost and an over-run error occurs. Note: When UART_9BIT_DATA_EN=0, this field width is 8. When UART_9BIT_DATA_EN=1, this field width is 9.

#### 14.17.3.2 IER — Offset 48204004h

Interrupt Enable Register - Interrupt Enable Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48204004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>PTIME:</b> Programmable THRE Interrupt Mode Enable. Writeable only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt.
6:5	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>ELCOLR:</b> Interrupt Enable Register: ELCOLR, this bit controls the method for clearing the status in the LSR register. This is applicable only for Overrun Error, Parity Error, Framing Error, and Break Interrupt status bits. 0 = LSR status bits are cleared either on reading Rx FIFO (RBR Read) or On reading LSR register. 1 = LSR status bits are cleared only on reading LSR register. Writeable only when LSR_STATUS_CLEAR == Enabled, always readable.
3	0h RW	<b>EDSSI:</b> Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt.
2	0h RW	<b>ELSI:</b> Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt.
1	0h RW	<b>ETBEI:</b> Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt.
0	0h RW	<b>ERBFI:</b> Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFO's enabled). These are the second highest priority interrupts.

### 14.17.3.3 IIR — Offset 48204008h

Interrupt Identification Register - Interrupt Identification Register

Type	Size	Offset	Default
MMIO	32 bit	48204008h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:6	0h RO/V	<b>FIFOE:</b> FIFOs Enabled (or FIFOE). This is used to indicate whether the FIFOs are enabled or disabled.
5:4	0h RO	<b>Reserved</b>
3:0	1h RO/V	<b>IID:</b> Interrupt ID (or IID). This indicates the highest priority pending interrupt which can be one of the following types specified in Values. For information on several levels into which the interrupt priorities are split into, see the 'Interrupts' section in the DW_apb_uart Databook. Note: an interrupt of type 0111 (busy detect) will never get indicated if UART_16550_COMPATIBLE == YES in coreConsultant. Bit 3 indicates an interrupt can only occur when the FIFOs are enabled and used to distinguish a Character Timeout condition interrupt.

#### 14.17.3.4 LCR — Offset 4820400Ch

Line Control Register - Line Control Register

Type	Size	Offset	Default
MMIO	32 bit	4820400Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>DLAB:</b> Divisor Latch Access Bit. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH/LPDLH and LPDLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers.
6	0h RW	<b>BC:</b> Break Control Bit. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.
5	0h RW	<b>SP:</b> Stick Parity. If UART_16550_COMPATIBLE = NO, then writeable only when UART is not busy (USR[0] is 0); otherwise always writable and always readable. This bit is used to force parity value. When PEN, EPS and Stick Parity are set to 1, the parity bit is transmitted and checked as logic 0. If PEN and Stick Parity are set to 1 and EPS is a logic 0, then parity bit is transmitted and checked as a logic 1. If this bit is set to 0, Stick Parity is disabled.
4	0h RW	<b>EPS:</b> Even Parity Select. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic '1's is transmitted or checked. If set to zero, an odd number of logic '1's is transmitted or checked.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	<b>PEN:</b> Parity Enable . If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively.
2	0h RW	<b>STOP:</b> Number of stop bits. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select the number of stop bits per character that the peripheral will transmit and receive. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected the receiver will only check the first stop bit. Note: NOTE: The STOP bit duration implemented by DW_apb_uart may appear longer due to idle time inserted between characters for some configurations and baud clock divisor values in the transmit direction; for details on idle time between transmitted transfers, refer to 'Back-to-Back Character Stream Transmission' section in data book.
1:0	0h RW	<b>DLS:</b> Data Length Select (or CLS as used in legacy). If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. When DLS_E in LCR_EXT is set to 0, this register is used to select the number of data bits per character that the peripheral will transmit and receive.

#### 14.17.3.5 MCR — Offset 48204010h

Modem Control Register - Modem Control Register

Type	Size	Offset	Default
MMIO	32 bit	48204010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>SIRE:</b> SIR Mode Enable . Writeable only when SIR_MODE == Enabled, always readable. This is used to enable/ disable the IrDA SIR Mode features as described in section 'IrDA 1.0 SIR Protocol' in the databook. Note: To enable SIR mode, write the appropriate value to the MCR register before writing to the LCR register. For details of the recommended programming sequence, refer to 'Programing Examples' section of data book.
5	0h RW	<b>AFCE:</b> Auto Flow Control Enable . Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in section 'Auto Flow Control' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>LOOPBACK:</b> LoopBack Bit . This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled OR NOT active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.
3	0h RW	<b>OUT2:</b> OUT2 . This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n. Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.
2	0h RW	<b>OUT1:</b> OUT1 . This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n. Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.
1	0h RW	<b>RTS:</b> Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFO's enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal will be de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input.
0	0h RW	<b>DTR:</b> Data Terminal Ready. This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n. The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input.

#### 14.17.3.6 LSR — Offset 48204014h

Line Status Register - Line Status Register

Type	Size	Offset	Default
MMIO	32 bit	48204014h	00000060h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RO/V	<b>ADDR_RCVD:</b> Address Received Bit. If 9Bit data mode (LCR_EXT[0]=1) is enabled, this bit is used to indicate the 9th bit of the receive data is set to 1. This bit can also be used to indicate whether the incoming character is address or data. - 1 = Indicates the character is address. - 0 = Indicates the character is data. In the FIFO mode, since the 9th bit is associated with a character received, it is revealed when the character with the 9th bit set to 1 is at the top of the FIFO. Reading the LSR clears the 9BIT. Note: User needs to ensure that interrupt gets cleared (reading LSR register) before the next address byte arrives. If there is a delay in clearing the interrupt, then Software will not be able to distinguish between multiple address related interrupt.
7	0h RO/V	<b>RFE:</b> Receiver FIFO Error bit. This bit is only relevant when FIFO_MODE != NONE AND FIFO's are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1h RO/V	<b>TEM:</b> Transmitter Empty bit. If in FIFO mode (FIFO_MODE != NONE) and FIFO's enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in the non-FIFO mode or FIFO's are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.
5	1h RO/V	<b>THRE:</b> Transmit Holding Register Empty bit. If THRE_MODE_USER = Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Programmable THRE interrupt mode operation is described in detail in section 'Programmable THRE Interrupt' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>BI:</b> Break Interrupt bit. This is used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the BI bit (if LSR_STATUS_CLEAR==0). In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. Note: If a FIFO is full when a break condition is received, a FIFO overrun occurs. The break condition and all the information associated with it-parity and framing errors-is discarded; any information that a break character was received is lost.
3	0h RO/V	<b>FE:</b> Framing Error bit. This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs the UART will try resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). This happens because the break character implicitly generates a framing error by holding the sin input to logic 0 for longer than the duration of a character. Reading the LSR clears the FE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the FE bit (if LSR_STATUS_CLEAR==0).
2	0h RO/V	<b>PE:</b> Parity Error bit. This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). In this situation, the Parity Error bit is set if parity generation and detection is enabled (LCR[3]=1) and the parity is set to odd (LCR[4]=0). Reading the LSR clears the PE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the PE bit (if LSR_STATUS_CLEAR==0).
1	0h RO/V	<b>OE:</b> Overrun error bit. This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. Reading the LSR clears the OE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the OE bit (if LSR_STATUS_CLEAR==0).
0	0h RO/V	<b>DR:</b> Data Ready bit. This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. This bit is cleared when the RBR is read in the non-FIFO mode, or when the receiver FIFO is empty, in the FIFO mode.

#### 14.17.3.7 MSR – Offset 48204018h

Modem Status Register - Whenever bits 0, 1, 2 or 3 is set to logic one, to indicate a change on the modem control inputs, a modem status interrupt will be generated if enabled via the IER regardless of when the change occurred. The bits (bits 0, 1, 3) can be set after a reset-even though their respective modem signals are inactive-because

the synchronized version of the modem signals have a reset value of 0 and change to value 1 after reset. To prevent unwanted interrupts due to this change, a read of the MSR register can be performed after reset.

Type	Size	Offset	Default
MMIO	32 bit	48204018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RO/V	<b>DCD:</b> Data Carrier Detect. This is used to indicate the current state of the modem control line dcd_n. That is this bit is the complement dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2).
6	0h RO/V	<b>RI:</b> Ring Indicator. This is used to indicate the current state of the modem control line ri_n. That is this bit is the complement ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1).
5	0h RO/V	<b>DSR:</b> Data Set Ready. This is used to indicate the current state of the modem control line dsr_n. That is this bit is the complement dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR).
4	0h RO/V	<b>CTS:</b> Clear to Send. This is used to indicate the current state of the modem control line cts_n. That is, this bit is the complement cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), CTS is the same as MCR[1] (RTS).
3	0h RO/V	<b>DDCD:</b> Delta Data Carrier Detect. This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] set to one), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit will get set when the reset is removed if the dcd_n signal remains asserted.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO/V	<b>TERI:</b> Trailing Edge of Ring Indicator. This is used to indicate that a change on the input ri_n (from an active low, to an inactive high state) has occurred since the last time the MSR was read. Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] set to one), TERI reflects when MCR[2] (Out1) has changed state from a high to a low.
1	0h RO/V	<b>DDSR:</b> Delta Data Set Ready. This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] set to one), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit will get set when the reset is removed if the dsr_n signal remains asserted.
0	0h RO/V	<b>DCTS:</b> Delta Clear to Send. This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] set to one), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit will get set when the reset is removed if the cts_n signal remains asserted.

#### 14.17.3.8 SCR — Offset 4820401Ch

Scratchpad Register - Scratchpad Register

Type	Size	Offset	Default
MMIO	32 bit	4820401Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>SCR:</b> This register is for programmers to use as a temporary storage space. It has no defined purpose in the DW_apb_uart.

#### 14.17.3.9 FAR — Offset 48204070h

FIFO Access Register - FIFO Access Register

Type	Size	Offset	Default
MMIO	32 bit	48204070h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>FAR:</b> Writes will have no effect when FIFO_ACCESS == No, always readable. This register is used to enable a FIFO access mode for testing, so that the receive FIFO can be written by the master and the transmit FIFO can be read by the master when FIFO's are implemented and enabled. When FIFOs are not implemented or not enabled it allows the RBR to be written by the master and the THR to be read by the master. Note, that when the FIFO access mode is enabled/disabled, the control portion of the receive FIFO and transmit FIFO is reset and the FIFO's are treated as empty.

#### 14.17.3.10 USR — Offset 4820407Ch

UART Status register - UART Status register.

Type	Size	Offset	Default
MMIO	32 bit	4820407Ch	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO is completely full. That is: This bit is cleared when the RX FIFO is no longer full.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO contains one or more entries. This bit is cleared when the RX FIFO is empty.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is completely empty. This bit is cleared when the TX FIFO is no longer empty.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is not full. This bit is cleared when the TX FIFO is full.
0	0h RO	<b>Reserved</b>

#### 14.17.3.11 TFL — Offset 48204080h

Transmit FIFO Level - TFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48204080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TFL:</b> Transmit FIFO Level. This indicates the number of data entries in the transmit FIFO.

#### 14.17.3.12 RFL — Offset 48204084h

Receive FIFO Level - RFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48204084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RFL:</b> Receive FIFO Level. This indicates the number of data entries in the receive FIFO.

#### 14.17.3.13 HTX — Offset 482040A4h

Halt TX - Halt TX

Type	Size	Offset	Default
MMIO	32 bit	482040A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>HTX:</b> Halt TX. Writes will have no effect when FIFO_MODE == NONE, always readable. This register is use to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFO's are implemented and enabled. Note, if FIFO's are implemented and not enabled the setting of the halt TX register will have no effect on operation.

#### 14.17.3.14 DMASA — Offset 482040A8h

DMA Software Acknowledge Register - DMA Software Acknowledge Register

Type	Size	Offset	Default
MMIO	32 bit	482040A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h WO	<b>DMASA:</b> DMA Software Acknowledge. Writes will have no effect when DMA_EXTRA == No. This register is use to perform DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This will cause the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing' and it is not necessary to clear this bit.

#### 14.17.3.15 TCR – Offset 482040ACh

Transceiver Control Register - This register is used to enable or disable RS485 mode and also control the polarity values for Driven enable (de) and Receiver Enable (re) signals. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	482040ACh	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:3	0h RW	<b>XFER_MODE:</b> Transfer Mode. - 0: In this mode, transmit and receive can happen simultaneously. The user can enable DE_EN, RE_EN at any point of time. Turn around timing as programmed in the TAT register is not applicable in this mode. - 1: In this mode, DE and RE are mutually exclusive. Either DE or RE only one of them is expected to be enabled through programming. Hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. For transmission Hardware will wait if it is in middle of receiving any transfer, before it starts transmitting. - 2: In this mode, DE and RE are mutually exclusive. Once DE_EN/RE_EN is programmed - by default 're' will be enabled and DW_apb_uart controller will be ready to receive. If the user programs the TX FIFO with the data then DW_apb_uart, after ensuring no receive is in progress, disable 're' and enable 'de' signal. Once the TX FIFO becomes empty, 're' signal gets enabled and 'de' signal will be disabled. In this mode of operation hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. In this mode, 'de' and 're' signals are strictly complementary to each other.
2	1h RW	<b>DE_POL:</b> Driver Enable Polarity. - 1: DE signal is active high - 0: DE signal is active low
1	1h RW	<b>RE_POL:</b> Receiver Enable Polarity. - 1: RE signal is active high - 0: RE signal is active low
0	0h RW	<b>RS485_EN:</b> RS485 Transfer Enable. - 0 : In this mode, the transfers are still in the RS232 mode. All other fields in this register are reserved and register DE_EN/RE_EN/TAT are also reserved. - 1 : In this mode, the transfers will happen in RS485 mode. All other fields of this register are applicable.

#### 14.17.3.16 DE\_EN – Offset 482040B0h

Driver Output Enable Register - The Driver Output Enable Register (DE\_EN) is used to control the assertion and de-assertion of the DE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482040B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>DE_ENABLE:</b> DE Enable control. The 'DE Enable' register bit is used to control assertion and de-assertion of 'de' signal. - 0: De-assert 'de' signal - 1: Assert 'de' signal

#### 14.17.3.17 RE\_EN — Offset 482040B4h

Receiver Output Enable Register - The Receiver Output Enable Register (RE\_EN) is used to control the assertion and de-assertion of the RE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If the RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482040B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>RE_ENABLE:</b> RE Enable control. The 'RE Enable' register bit is used to control assertion and de-assertion of 're' signal. - 0: De-assert 're' signal - 1: Assert 're' signal

#### 14.17.3.18 DET — Offset 482040B8h

Driver Output Enable Timing Register - The Driver Output Enable Timing Register (DET) is used to control the DE assertion and de-assertion timings of 'de' signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482040B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	00h RW	<b>DE_DE_ASSERTION_TIME:</b> Driver Enable de-assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the end of stop bit on the sout to the falling edge of Driver output enable signal.
15:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>DE_ASSERTION_TIME:</b> Driver Enable assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the assertion of rising edge of Driver output enable signal to serial transmit enable. Any data in transmit buffer, will start on serial output (sout) after the transmit enable.

#### 14.17.3.19 TAT — Offset 482040BCh

TurnAround Timing Register - The TurnAround Timing Register (TAT) is used to hold the turnaround time between switching of 're' and 'de' signals. This register is only valid when the DW\_apb\_uart is configured to have the RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482040BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>RE_TO_DE:</b> Receiver Enable to Driver Enable TurnAround time. Turnaround time (in terms of serial clock) for RE De-assertion to DE assertion. Note: - If the DE assertion time in the DET register is 0, then the actual value is the programmed value + 3. - If the DE assertion time in the DET register is 1, then the actual value is the programmed value + 2. - If the DE assertion time in the DET register is greater than 1, then the actual value is the programmed value + 1.
15:0	0000h RW	<b>DE_TO_RE:</b> Driver Enable to Receiver Enable TurnAround time. Turnaround time (in terms of serial clock) for DE De-assertion to RE assertion. Note: The actual time is the programmed value + 1.

#### 14.17.3.20 DLF – Offset 482040C0h

Divisor Latch Fraction Register - This register is only valid when the DW\_apb\_uart is configured to have Fractional Baud rate Divisor implemented (FRACTIONAL\_BAUD\_DIVISOR\_EN = ENABLED). If Fractional Baud rate divisor is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482040C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>DLF:</b> Fractional part of divisor. The fractional value is added to integer value set by DLH, DLL. Fractional value is determined by (Divisor Fraction value)/(2^DLF_SIZE). For information on DLF values to be programmed for DLF_SIZE=4, see the 'Fractional Baud Rate Support' section in the DW_apb_uart Databook.

#### 14.17.3.21 RAR – Offset 482040C4h

Receive Address Register - Receive Address Register

Type	Size	Offset	Default
MMIO	32 bit	482040C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RAR:</b> This is an address matching register during receive mode. If the 9-th bit is set in the incoming character then the remaining 8-bits will be checked against this register value. If the match happens then sub-sequent characters with 9-th bit set to 0 will be treated as data byte until the next address byte is received. Note: - This register is applicable only when 'ADDR_MATCH'(LCR_EXT[1] and 'DLS_E' (LCR_EXT[0]) bits are set to 1. - If UART_16550_COMPATIBLE is configured to 0, then RAR should be programmed only when UART is not busy. - If UART_16550_COMPATIBLE is configured to 0, then RAR can be programmed at any point of the time. However, user must not change this register value when any receive is in progress.

#### 14.17.3.22 TAR — Offset 482040C8h

Transmit Address Register - Transmit Address Register

Type	Size	Offset	Default
MMIO	32 bit	482040C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>TAR:</b> This is an address matching register during transmit mode. If DLS_E (LCR_EXT[0]) bit is enabled, then DW_apb_uart will send the 9-bit character with 9-th bit set to 1 and remaining 8-bit address will be sent from this register provided 'SEND_ADDR' (LCR_EXT[2]) bit is set to 1. Note: - This register is used only to send the address. The normal data should be sent by programming THR register. - Once the address is started to send on the DW_apb_uart serial lane, then 'SEND_ADDR' bit will be auto-cleared by the hardware.

#### 14.17.3.23 LCR\_EXT — Offset 482040CCh

Line Extended Control Register - Line Extended Control Register

Type	Size	Offset	Default
MMIO	32 bit	482040CCh	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW/V	<b>TRANSMIT_MODE:</b> Transmit mode control bit. This bit is used to control the type of transmit mode during 9-bit data transfers. - 1: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding Register (STHR) are 9-bit wide. The user needs to ensure that the THR/STHR register is written correctly for address/data. Address: 9th bit is set to 1, Data : 9th bit is set to 0. Note: Transmit address register (TAR) is not applicable in this mode of operation. - 0: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding register (STHR) are 8-bit wide. The user needs to program the address into Transmit Address Register (TAR) and data into the THR/STHR register. SEND_ADDR bit is used as a control knob to indicate the DW_apb_uart on when to send the address.
2	0h RW/V	<b>SEND_ADDR:</b> Send address control bit. This bit is used as a control knob for the user to determine when to send the address during transmit mode. - 1 = 9-bit character will be transmitted with 9-th bit set to 1 and the remaining 8-bits will match to what is being programmed in 'Transmit Address Register'. - 0 = 9-bit character will be transmitted with 9-th bit set to 0 and the remaining 8-bits will be taken from the TXFIFO which is programmed through 8-bit wide THR/STHR register. Note: - 1. This bit is auto-cleared by the hardware, after sending out the address character. User is not expected to program this bit to 0. - 2. This field is applicable only when DLS_E bit is set to 1 and TRANSMIT_MODE is set to 0.
1	0h RW/V	<b>ADDR_MATCH:</b> Address Match Mode. This bit is used to enable the address match feature during receive. - 1 = Address match mode; DW_apb_uart will wait until the incoming character with 9-th bit set to 1. And further checks to see if the address matches with what is programmed in 'Receive Address Match Register'. If match is found, then subsequent characters will be treated as valid data and DW_apb_uart starts receiving data. - 0 = Normal mode; DW_apb_uart will start to receive the data and 9-bit character will be formed and written into the receive RXFIFO. User is responsible to read the data and differentiate b/n address and data. Note: This field is applicable only when DLS_E is set to 1.
0	0h RW/V	<b>DLS_E:</b> Extension for DLS. This bit is used to enable 9-bit data for transmit and receive transfers.

#### 14.17.3.24 CPR – Offset 482040F4h

Component Parameter Register - Component Parameter Register. This register is valid only when UART\_ADD\_ENCODED\_PARAMS = 1. If the UART\_ADD\_ENCODED\_PARAMS parameter is not set, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482040F4h	00043532h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	04h RO/V	<b>FIFO_MODE:</b> Encoding of FIFO_MODE configuration parameter value.
15:14	0h RO	<b>Reserved</b>
13	1h RO/V	<b>DMA_EXTRA:</b> Encoding of DMA_EXTRA configuration parameter value.
12	1h RO/V	<b>UART_ADD_ENCODED_PARAMS:</b> Encoding of UART_ADD_ENCODED_PARAMS configuration parameter value.
11	0h RO/V	<b>SHADOW:</b> Encoding of SHADOW configuration parameter value.
10	1h RO/V	<b>FIFO_STAT:</b> Encoding of FIFO_STAT configuration parameter value.
9	0h RO/V	<b>FIFO_ACCESS:</b> Encoding of FIFO_ACCESS configuration parameter value.
8	1h RO/V	<b>ADDITIONAL_FEAT:</b> Encoding of ADDITIONAL_FEATURES configuration parameter value.
7	0h RO/V	<b>SIR_LP_MODE:</b> Encoding of SIR_LP_MODE configuration parameter value.
6	0h RO/V	<b>SIR_MODE:</b> Encoding of SIR_MODE configuration parameter value.
5	1h RO/V	<b>THRE_MODE:</b> Encoding of THRE_MODE configuration parameter value.
4	1h RO/V	<b>AFCE_MODE:</b> Encoding of AFCE_MODE configuration parameter value.
3:2	0h RO	<b>Reserved</b>
1:0	2h RO/V	<b>APB_DATA_WIDTH:</b> Encoding of APB_DATA_WIDTH configuration parameter value.

#### 14.17.3.25 UCV – Offset 482040F8h

UART Component Version - UCV register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482040F8h	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>UART_COMPONENT_VERSION:</b> ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*

#### 14.17.3.26 CTR – Offset 482040FCh

Component Type Register - CTR is register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482040FCh	44570110h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570110h RO/V	<b>PERIPHERAL_ID:</b> This register contains the peripherals identification code.

#### 14.17.4 UART\_3 Registers Summary

**Table 14-33. Summary of UART\_3 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48206000h	4	RBR	00000000h
48206004h	4	IER	00000000h
48206008h	4	IIR	00000001h
4820600Ch	4	LCR	00000000h
48206010h	4	MCR	00000000h
48206014h	4	LSR	00000060h
48206018h	4	MSR	00000000h
4820601Ch	4	SCR	00000000h
48206070h	4	FAR	00000000h
4820607Ch	4	USR	00000006h
48206080h	4	TFI	00000000h
48206084h	4	RFL	00000000h
482060A4h	4	HTX	00000000h
482060A8h	4	DMASA	00000000h
482060ACh	4	TCR	00000006h
482060B0h	4	DE_EN	00000000h

482060C8h	4	TAR	00000000h
482060CCh	4	LCR_EXT	00000000h
482060F4h	4	CPR	00043532h
482060F8h	4	UCV	3430322Ah
482060FCh	4	CTR	44570110h

##### 14.17.4.1 RBR — Offset 48206000h

Receive Buffer Register - Receive Buffer Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48206000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8:0	000h RO/V	<b>RBR:</b> Receive Buffer Register. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to 0), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an over-run error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to 1), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost and an over-run error occurs. Note: When UART_9BIT_DATA_EN=0, this field width is 8. When UART_9BIT_DATA_EN=1, this field width is 9.

#### 14.17.4.2 IER — Offset 48206004h

Interrupt Enable Register - Interrupt Enable Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48206004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>PTIME:</b> Programmable THRE Interrupt Mode Enable. Writeable only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt.
6:5	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>ELCOLR:</b> Interrupt Enable Register: ELCOLR, this bit controls the method for clearing the status in the LSR register. This is applicable only for Overrun Error, Parity Error, Framing Error, and Break Interrupt status bits. 0 = LSR status bits are cleared either on reading Rx FIFO (RBR Read) or On reading LSR register. 1 = LSR status bits are cleared only on reading LSR register. Writeable only when LSR_STATUS_CLEAR == Enabled, always readable.
3	0h RW	<b>EDSSI:</b> Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt.
2	0h RW	<b>ELSI:</b> Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt.
1	0h RW	<b>ETBEI:</b> Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt.
0	0h RW	<b>ERBFI:</b> Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFO's enabled). These are the second highest priority interrupts.

#### 14.17.4.3 IIR — Offset 48206008h

Interrupt Identification Register - Interrupt Identification Register

Type	Size	Offset	Default
MMIO	32 bit	48206008h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:6	0h RO/V	<b>FIFOE:</b> FIFOs Enabled (or FIFOE). This is used to indicate whether the FIFOs are enabled or disabled.
5:4	0h RO	<b>Reserved</b>
3:0	1h RO/V	<b>IID:</b> Interrupt ID (or IID). This indicates the highest priority pending interrupt which can be one of the following types specified in Values. For information on several levels into which the interrupt priorities are split into, see the 'Interrupts' section in the DW_apb_uart Databook. Note: an interrupt of type 0111 (busy detect) will never get indicated if UART_16550_COMPATIBLE == YES in coreConsultant. Bit 3 indicates an interrupt can only occur when the FIFOs are enabled and used to distinguish a Character Timeout condition interrupt.

#### 14.17.4.4 LCR — Offset 4820600Ch

Line Control Register - Line Control Register

Type	Size	Offset	Default
MMIO	32 bit	4820600Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>DLAB:</b> Divisor Latch Access Bit. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH/LPDLH and LPDLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers.
6	0h RW	<b>BC:</b> Break Control Bit. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.
5	0h RW	<b>SP:</b> Stick Parity. If UART_16550_COMPATIBLE = NO, then writeable only when UART is not busy (USR[0] is 0); otherwise always writable and always readable. This bit is used to force parity value. When PEN, EPS and Stick Parity are set to 1, the parity bit is transmitted and checked as logic 0. If PEN and Stick Parity are set to 1 and EPS is a logic 0, then parity bit is transmitted and checked as a logic 1. If this bit is set to 0, Stick Parity is disabled.
4	0h RW	<b>EPS:</b> Even Parity Select. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic '1's is transmitted or checked. If set to zero, an odd number of logic '1's is transmitted or checked.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	<b>PEN:</b> Parity Enable . If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively.
2	0h RW	<b>STOP:</b> Number of stop bits. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select the number of stop bits per character that the peripheral will transmit and receive. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected the receiver will only check the first stop bit. Note: NOTE: The STOP bit duration implemented by DW_apb_uart may appear longer due to idle time inserted between characters for some configurations and baud clock divisor values in the transmit direction; for details on idle time between transmitted transfers, refer to 'Back-to-Back Character Stream Transmission' section in data book.
1:0	0h RW	<b>DLS:</b> Data Length Select (or CLS as used in legacy). If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. When DLS_E in LCR_EXT is set to 0, this register is used to select the number of data bits per character that the peripheral will transmit and receive.

#### 14.17.4.5 MCR — Offset 48206010h

Modem Control Register - Modem Control Register

Type	Size	Offset	Default
MMIO	32 bit	48206010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>SIRE:</b> SIR Mode Enable . Writeable only when SIR_MODE == Enabled, always readable. This is used to enable/ disable the IrDA SIR Mode features as described in section 'IrDA 1.0 SIR Protocol' in the databook. Note: To enable SIR mode, write the appropriate value to the MCR register before writing to the LCR register. For details of the recommended programming sequence, refer to 'Programing Examples' section of data book.
5	0h RW	<b>AFCE:</b> Auto Flow Control Enable . Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in section 'Auto Flow Control' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>LOOPBACK:</b> LoopBack Bit . This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled OR NOT active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.
3	0h RW	<b>OUT2:</b> OUT2 . This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n. Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.
2	0h RW	<b>OUT1:</b> OUT1 . This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n. Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.
1	0h RW	<b>RTS:</b> Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFO's enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal will be de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input.
0	0h RW	<b>DTR:</b> Data Terminal Ready. This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n. The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input.

#### 14.17.4.6 LSR — Offset 48206014h

Line Status Register - Line Status Register

Type	Size	Offset	Default
MMIO	32 bit	48206014h	00000060h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RO/V	<b>ADDR_RCVD:</b> Address Received Bit. If 9Bit data mode (LCR_EXT[0]=1) is enabled, this bit is used to indicate the 9th bit of the receive data is set to 1. This bit can also be used to indicate whether the incoming character is address or data. - 1 = Indicates the character is address. - 0 = Indicates the character is data. In the FIFO mode, since the 9th bit is associated with a character received, it is revealed when the character with the 9th bit set to 1 is at the top of the FIFO. Reading the LSR clears the 9BIT. Note: User needs to ensure that interrupt gets cleared (reading LSR register) before the next address byte arrives. If there is a delay in clearing the interrupt, then Software will not be able to distinguish between multiple address related interrupt.
7	0h RO/V	<b>RFE:</b> Receiver FIFO Error bit. This bit is only relevant when FIFO_MODE != NONE AND FIFO's are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1h RO/V	<b>TEM:</b> Transmitter Empty bit. If in FIFO mode (FIFO_MODE != NONE) and FIFO's enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in the non-FIFO mode or FIFO's are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.
5	1h RO/V	<b>THRE:</b> Transmit Holding Register Empty bit. If THRE_MODE_USER = Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Programmable THRE interrupt mode operation is described in detail in section 'Programmable THRE Interrupt' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>BI:</b> Break Interrupt bit. This is used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the BI bit (if LSR_STATUS_CLEAR==0). In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. Note: If a FIFO is full when a break condition is received, a FIFO overrun occurs. The break condition and all the information associated with it-parity and framing errors-is discarded; any information that a break character was received is lost.
3	0h RO/V	<b>FE:</b> Framing Error bit. This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs the UART will try resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). This happens because the break character implicitly generates a framing error by holding the sin input to logic 0 for longer than the duration of a character. Reading the LSR clears the FE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the FE bit (if LSR_STATUS_CLEAR==0).
2	0h RO/V	<b>PE:</b> Parity Error bit. This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). In this situation, the Parity Error bit is set if parity generation and detection is enabled (LCR[3]=1) and the parity is set to odd (LCR[4]=0). Reading the LSR clears the PE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the PE bit (if LSR_STATUS_CLEAR==0).
1	0h RO/V	<b>OE:</b> Overrun error bit. This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. Reading the LSR clears the OE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the OE bit (if LSR_STATUS_CLEAR==0).
0	0h RO/V	<b>DR:</b> Data Ready bit. This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. This bit is cleared when the RBR is read in the non-FIFO mode, or when the receiver FIFO is empty, in the FIFO mode.

#### 14.17.4.7 MSR — Offset 48206018h

Modem Status Register - Whenever bits 0, 1, 2 or 3 is set to logic one, to indicate a change on the modem control inputs, a modem status interrupt will be generated if enabled via the IER regardless of when the change occurred. The bits (bits 0, 1, 3) can be set after a reset-even though their respective modem signals are inactive-because

the synchronized version of the modem signals have a reset value of 0 and change to value 1 after reset. To prevent unwanted interrupts due to this change, a read of the MSR register can be performed after reset.

Type	Size	Offset	Default
MMIO	32 bit	48206018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RO/V	<b>DCD:</b> Data Carrier Detect. This is used to indicate the current state of the modem control line dcd_n. That is this bit is the complement dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2).
6	0h RO/V	<b>RI:</b> Ring Indicator. This is used to indicate the current state of the modem control line ri_n. That is this bit is the complement ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1).
5	0h RO/V	<b>DSR:</b> Data Set Ready. This is used to indicate the current state of the modem control line dsr_n. That is this bit is the complement dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR).
4	0h RO/V	<b>CTS:</b> Clear to Send. This is used to indicate the current state of the modem control line cts_n. That is, this bit is the complement cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), CTS is the same as MCR[1] (RTS).
3	0h RO/V	<b>DDCD:</b> Delta Data Carrier Detect. This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] set to one), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit will get set when the reset is removed if the dcd_n signal remains asserted.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO/V	<b>TERI:</b> Trailing Edge of Ring Indicator. This is used to indicate that a change on the input ri_n (from an active low, to an inactive high state) has occurred since the last time the MSR was read. Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] set to one), TERI reflects when MCR[2] (Out1) has changed state from a high to a low.
1	0h RO/V	<b>DDSR:</b> Delta Data Set Ready. This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] set to one), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit will get set when the reset is removed if the dsr_n signal remains asserted.
0	0h RO/V	<b>DCTS:</b> Delta Clear to Send. This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] set to one), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit will get set when the reset is removed if the cts_n signal remains asserted.

#### 14.17.4.8 SCR — Offset 4820601Ch

Scratchpad Register - Scratchpad Register

Type	Size	Offset	Default
MMIO	32 bit	4820601Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>SCR:</b> This register is for programmers to use as a temporary storage space. It has no defined purpose in the DW_apb_uart.

#### 14.17.4.9 FAR — Offset 48206070h

FIFO Access Register - FIFO Access Register

Type	Size	Offset	Default
MMIO	32 bit	48206070h	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>FAR:</b> Writes will have no effect when FIFO_ACCESS == No, always readable. This register is used to enable a FIFO access mode for testing, so that the receive FIFO can be written by the master and the transmit FIFO can be read by the master when FIFO's are implemented and enabled. When FIFOs are not implemented or not enabled it allows the RBR to be written by the master and the THR to be read by the master. Note, that when the FIFO access mode is enabled/disabled, the control portion of the receive FIFO and transmit FIFO is reset and the FIFO's are treated as empty.

#### 14.17.4.10 USR — Offset 4820607Ch

UART Status register - UART Status register.

Type	Size	Offset	Default
MMIO	32 bit	4820607Ch	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO is completely full. That is: This bit is cleared when the RX FIFO is no longer full.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO contains one or more entries. This bit is cleared when the RX FIFO is empty.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is completely empty. This bit is cleared when the TX FIFO is no longer empty.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is not full. This bit is cleared when the TX FIFO is full.
0	0h RO	<b>Reserved</b>

#### 14.17.4.11 TFL — Offset 48206080h

Transmit FIFO Level - TFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48206080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TFL:</b> Transmit FIFO Level. This indicates the number of data entries in the transmit FIFO.

#### 14.17.4.12 RFL — Offset 48206084h

Receive FIFO Level - RFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48206084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RFL:</b> Receive FIFO Level. This indicates the number of data entries in the receive FIFO.

#### 14.17.4.13 HTX — Offset 482060A4h

Halt TX - Halt TX

Type	Size	Offset	Default
MMIO	32 bit	482060A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>HTX:</b> Halt TX. Writes will have no effect when FIFO_MODE == NONE, always readable. This register is use to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFO's are implemented and enabled. Note, if FIFO's are implemented and not enabled the setting of the halt TX register will have no effect on operation.

#### 14.17.4.14 DMASA — Offset 482060A8h

DMA Software Acknowledge Register - DMA Software Acknowledge Register

Type	Size	Offset	Default
MMIO	32 bit	482060A8h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h WO	<b>DMASA:</b> DMA Software Acknowledge. Writes will have no effect when DMA_EXTRA == No. This register is use to perform DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This will cause the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing' and it is not necessary to clear this bit.

#### 14.17.4.15 TCR – Offset 482060ACh

Transceiver Control Register - This register is used to enable or disable RS485 mode and also control the polarity values for Driven enable (de) and Receiver Enable (re) signals. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	482060ACh	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:3	0h RW	<b>XFER_MODE:</b> Transfer Mode. - 0: In this mode, transmit and receive can happen simultaneously. The user can enable DE_EN, RE_EN at any point of time. Turn around timing as programmed in the TAT register is not applicable in this mode. - 1: In this mode, DE and RE are mutually exclusive. Either DE or RE only one of them is expected to be enabled through programming. Hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. For transmission Hardware will wait if it is in middle of receiving any transfer, before it starts transmitting. - 2: In this mode, DE and RE are mutually exclusive. Once DE_EN/RE_EN is programmed - by default 're' will be enabled and DW_apb_uart controller will be ready to receive. If the user programs the TX FIFO with the data then DW_apb_uart, after ensuring no receive is in progress, disable 're' and enable 'de' signal. Once the TX FIFO becomes empty, 're' signal gets enabled and 'de' signal will be disabled. In this mode of operation hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. In this mode, 'de' and 're' signals are strictly complementary to each other.
2	1h RW	<b>DE_POL:</b> Driver Enable Polarity. - 1: DE signal is active high - 0: DE signal is active low
1	1h RW	<b>RE_POL:</b> Receiver Enable Polarity. - 1: RE signal is active high - 0: RE signal is active low
0	0h RW	<b>RS485_EN:</b> RS485 Transfer Enable. - 0 : In this mode, the transfers are still in the RS232 mode. All other fields in this register are reserved and register DE_EN/RE_EN/TAT are also reserved. - 1 : In this mode, the transfers will happen in RS485 mode. All other fields of this register are applicable.

#### 14.17.4.16 DE\_EN – Offset 482060B0h

Driver Output Enable Register - The Driver Output Enable Register (DE\_EN) is used to control the assertion and de-assertion of the DE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482060B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>DE_ENABLE:</b> DE Enable control. The 'DE Enable' register bit is used to control assertion and de-assertion of 'de' signal. - 0: De-assert 'de' signal - 1: Assert 'de' signal

#### 14.17.4.17 RE\_EN — Offset 482060B4h

Receiver Output Enable Register - The Receiver Output Enable Register (RE\_EN) is used to control the assertion and de-assertion of the RE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If the RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482060B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>RE_ENABLE:</b> RE Enable control. The 'RE Enable' register bit is used to control assertion and de-assertion of 're' signal. - 0: De-assert 're' signal - 1: Assert 're' signal

#### 14.17.4.18 DET — Offset 482060B8h

Driver Output Enable Timing Register - The Driver Output Enable Timing Register (DET) is used to control the DE assertion and de-assertion timings of 'de' signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482060B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	00h RW	<b>DE_DE_ASSERTION_TIME:</b> Driver Enable de-assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the end of stop bit on the sout to the falling edge of Driver output enable signal.
15:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>DE_ASSERTION_TIME:</b> Driver Enable assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the assertion of rising edge of Driver output enable signal to serial transmit enable. Any data in transmit buffer, will start on serial output (sout) after the transmit enable.

#### 14.17.4.19 TAT — Offset 482060BCh

TurnAround Timing Register - The TurnAround Timing Register (TAT) is used to hold the turnaround time between switching of 're' and 'de' signals. This register is only valid when the DW\_apb\_uart is configured to have the RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482060BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>RE_TO_DE:</b> Receiver Enable to Driver Enable TurnAround time. Turnaround time (in terms of serial clock) for RE De-assertion to DE assertion. Note: - If the DE assertion time in the DET register is 0, then the actual value is the programmed value + 3. - If the DE assertion time in the DET register is 1, then the actual value is the programmed value + 2. - If the DE assertion time in the DET register is greater than 1, then the actual value is the programmed value + 1.
15:0	0000h RW	<b>DE_TO_RE:</b> Driver Enable to Receiver Enable TurnAround time. Turnaround time (in terms of serial clock) for DE De-assertion to RE assertion. Note: The actual time is the programmed value + 1.

#### 14.17.4.20 DLF – Offset 482060C0h

Divisor Latch Fraction Register - This register is only valid when the DW\_apb\_uart is configured to have Fractional Baud rate Divisor implemented (FRACTIONAL\_BAUD\_DIVISOR\_EN = ENABLED). If Fractional Baud rate divisor is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482060C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>DLF:</b> Fractional part of divisor. The fractional value is added to integer value set by DLH, DLL. Fractional value is determined by (Divisor Fraction value)/(2^DLF_SIZE). For information on DLF values to be programmed for DLF_SIZE=4, see the 'Fractional Baud Rate Support' section in the DW_apb_uart Databook.

#### 14.17.4.21 RAR – Offset 482060C4h

Receive Address Register - Receive Address Register

Type	Size	Offset	Default
MMIO	32 bit	482060C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RAR:</b> This is an address matching register during receive mode. If the 9-th bit is set in the incoming character then the remaining 8-bits will be checked against this register value. If the match happens then sub-sequent characters with 9-th bit set to 0 will be treated as data byte until the next address byte is received. Note: - This register is applicable only when 'ADDR_MATCH'(LCR_EXT[1] and 'DLS_E' (LCR_EXT[0]) bits are set to 1. - If UART_16550_COMPATIBLE is configured to 0, then RAR should be programmed only when UART is not busy. - If UART_16550_COMPATIBLE is configured to 0, then RAR can be programmed at any point of the time. However, user must not change this register value when any receive is in progress.

#### 14.17.4.22 TAR — Offset 482060C8h

Transmit Address Register - Transmit Address Register

Type	Size	Offset	Default
MMIO	32 bit	482060C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>TAR:</b> This is an address matching register during transmit mode. If DLS_E (LCR_EXT[0]) bit is enabled, then DW_apb_uart will send the 9-bit character with 9-th bit set to 1 and remaining 8-bit address will be sent from this register provided 'SEND_ADDR' (LCR_EXT[2]) bit is set to 1. Note: - This register is used only to send the address. The normal data should be sent by programming THR register. - Once the address is started to send on the DW_apb_uart serial lane, then 'SEND_ADDR' bit will be auto-cleared by the hardware.

#### 14.17.4.23 LCR\_EXT — Offset 482060CCh

Line Extended Control Register - Line Extended Control Register

Type	Size	Offset	Default
MMIO	32 bit	482060CCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW/V	<b>TRANSMIT_MODE:</b> Transmit mode control bit. This bit is used to control the type of transmit mode during 9-bit data transfers. - 1: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding Register (STHR) are 9-bit wide. The user needs to ensure that the THR/STHR register is written correctly for address/data. Address: 9th bit is set to 1, Data : 9th bit is set to 0. Note: Transmit address register (TAR) is not applicable in this mode of operation. - 0: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding register (STHR) are 8-bit wide. The user needs to program the address into Transmit Address Register (TAR) and data into the THR/STHR register. SEND_ADDR bit is used as a control knob to indicate the DW_apb_uart on when to send the address.
2	0h RW/V	<b>SEND_ADDR:</b> Send address control bit. This bit is used as a control knob for the user to determine when to send the address during transmit mode. - 1 = 9-bit character will be transmitted with 9-th bit set to 1 and the remaining 8-bits will match to what is being programmed in 'Transmit Address Register'. - 0 = 9-bit character will be transmitted with 9-th bit set to 0 and the remaining 8-bits will be taken from the TXFIFO which is programmed through 8-bit wide THR/STHR register. Note: - 1. This bit is auto-cleared by the hardware, after sending out the address character. User is not expected to program this bit to 0. - 2. This field is applicable only when DLS_E bit is set to 1 and TRANSMIT_MODE is set to 0.
1	0h RW/V	<b>ADDR_MATCH:</b> Address Match Mode. This bit is used to enable the address match feature during receive. - 1 = Address match mode; DW_apb_uart will wait until the incoming character with 9-th bit set to 1. And further checks to see if the address matches with what is programmed in 'Receive Address Match Register'. If match is found, then subsequent characters will be treated as valid data and DW_apb_uart starts receiving data. - 0 = Normal mode; DW_apb_uart will start to receive the data and 9-bit character will be formed and written into the receive RXFIFO. User is responsible to read the data and differentiate b/n address and data. Note: This field is applicable only when DLS_E is set to 1.
0	0h RW/V	<b>DLS_E:</b> Extension for DLS. This bit is used to enable 9-bit data for transmit and receive transfers.

#### 14.17.4.24 CPR – Offset 482060F4h

Component Parameter Register - Component Parameter Register. This register is valid only when UART\_ADD\_ENCODED\_PARAMS = 1. If the UART\_ADD\_ENCODED\_PARAMS parameter is not set, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482060F4h	00043532h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	04h RO/V	<b>FIFO_MODE:</b> Encoding of FIFO_MODE configuration parameter value.
15:14	0h RO	<b>Reserved</b>
13	1h RO/V	<b>DMA_EXTRA:</b> Encoding of DMA_EXTRA configuration parameter value.
12	1h RO/V	<b>UART_ADD_ENCODED_PARAMS:</b> Encoding of UART_ADD_ENCODED_PARAMS configuration parameter value.
11	0h RO/V	<b>SHADOW:</b> Encoding of SHADOW configuration parameter value.
10	1h RO/V	<b>FIFO_STAT:</b> Encoding of FIFO_STAT configuration parameter value.
9	0h RO/V	<b>FIFO_ACCESS:</b> Encoding of FIFO_ACCESS configuration parameter value.
8	1h RO/V	<b>ADDITIONAL_FEAT:</b> Encoding of ADDITIONAL_FEATURES configuration parameter value.
7	0h RO/V	<b>SIR_LP_MODE:</b> Encoding of SIR_LP_MODE configuration parameter value.
6	0h RO/V	<b>SIR_MODE:</b> Encoding of SIR_MODE configuration parameter value.
5	1h RO/V	<b>THRE_MODE:</b> Encoding of THRE_MODE configuration parameter value.
4	1h RO/V	<b>AFCE_MODE:</b> Encoding of AFCE_MODE configuration parameter value.
3:2	0h RO	<b>Reserved</b>
1:0	2h RO/V	<b>APB_DATA_WIDTH:</b> Encoding of APB_DATA_WIDTH configuration parameter value.

#### 14.17.4.25 UCV – Offset 482060F8h

UART Component Version - UCV register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482060F8h	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>UART_COMPONENT_VERSION:</b> ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*

#### 14.17.4.26 CTR – Offset 482060FCh

Component Type Register - CTR is register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482060FCh	44570110h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570110h RO/V	<b>PERIPHERAL_ID:</b> This register contains the peripherals identification code.

## 14.17.5 UART\_4 Registers Summary

**Table 14-34. Summary of UART\_4 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48208000h	4	RBR	00000000h
48208004h	4	IER	00000000h
48208008h	4	IIR	00000001h
4820800Ch	4	LCR	00000000h
48208010h	4	MCR	00000000h
48208014h	4	LSR	00000060h
48208018h	4	MSR	00000000h
4820801Ch	4	SCR	00000000h
48208070h	4	FAR	00000000h
4820807Ch	4	USR	00000006h
48208080h	4	TFL	00000000h
48208084h	4	RFL	00000000h
482080A4h	4	HTX	00000000h
482080A8h	4	DMASA	00000000h
482080ACh	4	TCR	00000006h
482080B0h	4	DE_EN	00000000h
482080B4h	4	RE_EN	00000000h
482080B8h	4	DET	00000000h
482080BCh	4	TAT	00000000h
482080C0h	4	DLF	00000000h
482080C4h	4	RAR	00000000h
482080C8h	4	TAR	00000000h
482080CCh	4	LCR_EXT	00000000h
482080F4h	4	CPR	00043532h
482080F8h	4	UCV	3430322Ah
482080FCh	4	CTR	44570110h

### 14.17.5.1 RBR — Offset 48208000h

Receive Buffer Register - Receive Buffer Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48208000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8:0	000h RO/V	<b>RBR:</b> Receive Buffer Register. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to 0), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an over-run error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to 1), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost and an over-run error occurs. Note: When UART_9BIT_DATA_EN=0, this field width is 8. When UART_9BIT_DATA_EN=1, this field width is 9.

#### 14.17.5.2 IER — Offset 48208004h

Interrupt Enable Register - Interrupt Enable Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	48208004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>PTIME:</b> Programmable THRE Interrupt Mode Enable. Writeable only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt.
6:5	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>ELCOLR:</b> Interrupt Enable Register: ELCOLR, this bit controls the method for clearing the status in the LSR register. This is applicable only for Overrun Error, Parity Error, Framing Error, and Break Interrupt status bits. 0 = LSR status bits are cleared either on reading Rx FIFO (RBR Read) or On reading LSR register. 1 = LSR status bits are cleared only on reading LSR register. Writeable only when LSR_STATUS_CLEAR == Enabled, always readable.
3	0h RW	<b>EDSSI:</b> Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt.
2	0h RW	<b>ELSI:</b> Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt.
1	0h RW	<b>ETBEI:</b> Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt.
0	0h RW	<b>ERBFI:</b> Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFO's enabled). These are the second highest priority interrupts.

### 14.17.5.3 IIR — Offset 48208008h

Interrupt Identification Register - Interrupt Identification Register

Type	Size	Offset	Default
MMIO	32 bit	48208008h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:6	0h RO/V	<b>FIFOE:</b> FIFOs Enabled (or FIFOE). This is used to indicate whether the FIFOs are enabled or disabled.
5:4	0h RO	<b>Reserved</b>
3:0	1h RO/V	<b>IID:</b> Interrupt ID (or IID). This indicates the highest priority pending interrupt which can be one of the following types specified in Values. For information on several levels into which the interrupt priorities are split into, see the 'Interrupts' section in the DW_apb_uart Databook. Note: an interrupt of type 0111 (busy detect) will never get indicated if UART_16550_COMPATIBLE == YES in coreConsultant. Bit 3 indicates an interrupt can only occur when the FIFOs are enabled and used to distinguish a Character Timeout condition interrupt.

#### 14.17.5.4 LCR — Offset 4820800Ch

Line Control Register - Line Control Register

Type	Size	Offset	Default
MMIO	32 bit	4820800Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>DLAB:</b> Divisor Latch Access Bit. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH/LPDLH and LPDLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers.
6	0h RW	<b>BC:</b> Break Control Bit. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.
5	0h RW	<b>SP:</b> Stick Parity. If UART_16550_COMPATIBLE = NO, then writeable only when UART is not busy (USR[0] is 0); otherwise always writable and always readable. This bit is used to force parity value. When PEN, EPS and Stick Parity are set to 1, the parity bit is transmitted and checked as logic 0. If PEN and Stick Parity are set to 1 and EPS is a logic 0, then parity bit is transmitted and checked as a logic 1. If this bit is set to 0, Stick Parity is disabled.
4	0h RW	<b>EPS:</b> Even Parity Select. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic '1's is transmitted or checked. If set to zero, an odd number of logic '1's is transmitted or checked.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	<b>PEN:</b> Parity Enable . If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively.
2	0h RW	<b>STOP:</b> Number of stop bits. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select the number of stop bits per character that the peripheral will transmit and receive. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected the receiver will only check the first stop bit. Note: NOTE: The STOP bit duration implemented by DW_apb_uart may appear longer due to idle time inserted between characters for some configurations and baud clock divisor values in the transmit direction; for details on idle time between transmitted transfers, refer to 'Back-to-Back Character Stream Transmission' section in data book.
1:0	0h RW	<b>DLS:</b> Data Length Select (or CLS as used in legacy). If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. When DLS_E in LCR_EXT is set to 0, this register is used to select the number of data bits per character that the peripheral will transmit and receive.

#### 14.17.5.5 MCR — Offset 48208010h

Modem Control Register - Modem Control Register

Type	Size	Offset	Default
MMIO	32 bit	48208010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>SIRE:</b> SIR Mode Enable . Writeable only when SIR_MODE == Enabled, always readable. This is used to enable/ disable the IrDA SIR Mode features as described in section 'IrDA 1.0 SIR Protocol' in the databook. Note: To enable SIR mode, write the appropriate value to the MCR register before writing to the LCR register. For details of the recommended programming sequence, refer to 'Programing Examples' section of data book.
5	0h RW	<b>AFCE:</b> Auto Flow Control Enable . Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in section 'Auto Flow Control' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>LOOPBACK:</b> LoopBack Bit . This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled OR NOT active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.
3	0h RW	<b>OUT2:</b> OUT2 . This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n. Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.
2	0h RW	<b>OUT1:</b> OUT1 . This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n. Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.
1	0h RW	<b>RTS:</b> Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFO's enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal will be de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input.
0	0h RW	<b>DTR:</b> Data Terminal Ready. This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n. The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input.

#### 14.17.5.6 LSR — Offset 48208014h

Line Status Register - Line Status Register

Type	Size	Offset	Default
MMIO	32 bit	48208014h	00000060h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RO/V	<b>ADDR_RCVD:</b> Address Received Bit. If 9Bit data mode (LCR_EXT[0]=1) is enabled, this bit is used to indicate the 9th bit of the receive data is set to 1. This bit can also be used to indicate whether the incoming character is address or data. - 1 = Indicates the character is address. - 0 = Indicates the character is data. In the FIFO mode, since the 9th bit is associated with a character received, it is revealed when the character with the 9th bit set to 1 is at the top of the FIFO. Reading the LSR clears the 9BIT. Note: User needs to ensure that interrupt gets cleared (reading LSR register) before the next address byte arrives. If there is a delay in clearing the interrupt, then Software will not be able to distinguish between multiple address related interrupt.
7	0h RO/V	<b>RFE:</b> Receiver FIFO Error bit. This bit is only relevant when FIFO_MODE != NONE AND FIFO's are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1h RO/V	<b>TEM:</b> Transmitter Empty bit. If in FIFO mode (FIFO_MODE != NONE) and FIFO's enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in the non-FIFO mode or FIFO's are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.
5	1h RO/V	<b>THRE:</b> Transmit Holding Register Empty bit. If THRE_MODE_USER = Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Programmable THRE interrupt mode operation is described in detail in section 'Programmable THRE Interrupt' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>BI:</b> Break Interrupt bit. This is used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the BI bit (if LSR_STATUS_CLEAR==0). In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. Note: If a FIFO is full when a break condition is received, a FIFO overrun occurs. The break condition and all the information associated with it-parity and framing errors-is discarded; any information that a break character was received is lost.
3	0h RO/V	<b>FE:</b> Framing Error bit. This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs the UART will try resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). This happens because the break character implicitly generates a framing error by holding the sin input to logic 0 for longer than the duration of a character. Reading the LSR clears the FE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the FE bit (if LSR_STATUS_CLEAR==0).
2	0h RO/V	<b>PE:</b> Parity Error bit. This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). In this situation, the Parity Error bit is set if parity generation and detection is enabled (LCR[3]=1) and the parity is set to odd (LCR[4]=0). Reading the LSR clears the PE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the PE bit (if LSR_STATUS_CLEAR==0).
1	0h RO/V	<b>OE:</b> Overrun error bit. This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. Reading the LSR clears the OE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the OE bit (if LSR_STATUS_CLEAR==0).
0	0h RO/V	<b>DR:</b> Data Ready bit. This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. This bit is cleared when the RBR is read in the non-FIFO mode, or when the receiver FIFO is empty, in the FIFO mode.

#### 14.17.5.7 MSR – Offset 48208018h

Modem Status Register - Whenever bits 0, 1, 2 or 3 is set to logic one, to indicate a change on the modem control inputs, a modem status interrupt will be generated if enabled via the IER regardless of when the change occurred. The bits (bits 0, 1, 3) can be set after a reset-even though their respective modem signals are inactive-because

the synchronized version of the modem signals have a reset value of 0 and change to value 1 after reset. To prevent unwanted interrupts due to this change, a read of the MSR register can be performed after reset.

Type	Size	Offset	Default
MMIO	32 bit	48208018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RO/V	<b>DCD:</b> Data Carrier Detect. This is used to indicate the current state of the modem control line dcd_n. That is this bit is the complement dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2).
6	0h RO/V	<b>RI:</b> Ring Indicator. This is used to indicate the current state of the modem control line ri_n. That is this bit is the complement ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1).
5	0h RO/V	<b>DSR:</b> Data Set Ready. This is used to indicate the current state of the modem control line dsr_n. That is this bit is the complement dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR).
4	0h RO/V	<b>CTS:</b> Clear to Send. This is used to indicate the current state of the modem control line cts_n. That is, this bit is the complement cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), CTS is the same as MCR[1] (RTS).
3	0h RO/V	<b>DDCD:</b> Delta Data Carrier Detect. This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] set to one), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit will get set when the reset is removed if the dcd_n signal remains asserted.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO/V	<b>TERI:</b> Trailing Edge of Ring Indicator. This is used to indicate that a change on the input ri_n (from an active low, to an inactive high state) has occurred since the last time the MSR was read. Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] set to one), TERI reflects when MCR[2] (Out1) has changed state from a high to a low.
1	0h RO/V	<b>DDSR:</b> Delta Data Set Ready. This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] set to one), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit will get set when the reset is removed if the dsr_n signal remains asserted.
0	0h RO/V	<b>DCTS:</b> Delta Clear to Send. This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] set to one), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit will get set when the reset is removed if the cts_n signal remains asserted.

#### 14.17.5.8 SCR — Offset 4820801Ch

Scratchpad Register - Scratchpad Register

Type	Size	Offset	Default
MMIO	32 bit	4820801Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>SCR:</b> This register is for programmers to use as a temporary storage space. It has no defined purpose in the DW_apb_uart.

#### 14.17.5.9 FAR — Offset 48208070h

FIFO Access Register - FIFO Access Register

Type	Size	Offset	Default
MMIO	32 bit	48208070h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>FAR:</b> Writes will have no effect when FIFO_ACCESS == No, always readable. This register is used to enable a FIFO access mode for testing, so that the receive FIFO can be written by the master and the transmit FIFO can be read by the master when FIFO's are implemented and enabled. When FIFOs are not implemented or not enabled it allows the RBR to be written by the master and the THR to be read by the master. Note, that when the FIFO access mode is enabled/disabled, the control portion of the receive FIFO and transmit FIFO is reset and the FIFO's are treated as empty.

#### 14.17.5.10 USR — Offset 4820807Ch

UART Status register - UART Status register.

Type	Size	Offset	Default
MMIO	32 bit	4820807Ch	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO is completely full. That is: This bit is cleared when the RX FIFO is no longer full.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO contains one or more entries. This bit is cleared when the RX FIFO is empty.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is completely empty. This bit is cleared when the TX FIFO is no longer empty.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is not full. This bit is cleared when the TX FIFO is full.
0	0h RO	<b>Reserved</b>

#### 14.17.5.11 TFL — Offset 48208080h

Transmit FIFO Level - TFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48208080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TFL:</b> Transmit FIFO Level. This indicates the number of data entries in the transmit FIFO.

#### 14.17.5.12 RFL — Offset 48208084h

Receive FIFO Level - RFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	48208084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RFL:</b> Receive FIFO Level. This indicates the number of data entries in the receive FIFO.

#### 14.17.5.13 HTX — Offset 482080A4h

Halt TX - Halt TX

Type	Size	Offset	Default
MMIO	32 bit	482080A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>HTX:</b> Halt TX. Writes will have no effect when FIFO_MODE == NONE, always readable. This register is use to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFO's are implemented and enabled. Note, if FIFO's are implemented and not enabled the setting of the halt TX register will have no effect on operation.

#### 14.17.5.14 DMASA — Offset 482080A8h

DMA Software Acknowledge Register - DMA Software Acknowledge Register

Type	Size	Offset	Default
MMIO	32 bit	482080A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h WO	<b>DMASA:</b> DMA Software Acknowledge. Writes will have no effect when DMA_EXTRA == No. This register is use to perform DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This will cause the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing' and it is not necessary to clear this bit.

#### 14.17.5.15 TCR – Offset 482080ACh

Transceiver Control Register - This register is used to enable or disable RS485 mode and also control the polarity values for Driven enable (de) and Receiver Enable (re) signals. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	482080ACh	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:3	0h RW	<b>XFER_MODE:</b> Transfer Mode. - 0: In this mode, transmit and receive can happen simultaneously. The user can enable DE_EN, RE_EN at any point of time. Turn around timing as programmed in the TAT register is not applicable in this mode. - 1: In this mode, DE and RE are mutually exclusive. Either DE or RE only one of them is expected to be enabled through programming. Hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. For transmission Hardware will wait if it is in middle of receiving any transfer, before it starts transmitting. - 2: In this mode, DE and RE are mutually exclusive. Once DE_EN/RE_EN is programmed - by default 're' will be enabled and DW_apb_uart controller will be ready to receive. If the user programs the TX FIFO with the data then DW_apb_uart, after ensuring no receive is in progress, disable 're' and enable 'de' signal. Once the TX FIFO becomes empty, 're' signal gets enabled and 'de' signal will be disabled. In this mode of operation hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. In this mode, 'de' and 're' signals are strictly complementary to each other.
2	1h RW	<b>DE_POL:</b> Driver Enable Polarity. - 1: DE signal is active high - 0: DE signal is active low
1	1h RW	<b>RE_POL:</b> Receiver Enable Polarity. - 1: RE signal is active high - 0: RE signal is active low
0	0h RW	<b>RS485_EN:</b> RS485 Transfer Enable. - 0 : In this mode, the transfers are still in the RS232 mode. All other fields in this register are reserved and register DE_EN/RE_EN/TAT are also reserved. - 1 : In this mode, the transfers will happen in RS485 mode. All other fields of this register are applicable.

#### 14.17.5.16 DE\_EN – Offset 482080B0h

Driver Output Enable Register - The Driver Output Enable Register (DE\_EN) is used to control the assertion and de-assertion of the DE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482080B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>DE_ENABLE:</b> DE Enable control. The 'DE Enable' register bit is used to control assertion and de-assertion of 'de' signal. - 0: De-assert 'de' signal - 1: Assert 'de' signal

#### 14.17.5.17 RE\_EN — Offset 482080B4h

Receiver Output Enable Register - The Receiver Output Enable Register (RE\_EN) is used to control the assertion and de-assertion of the RE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If the RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482080B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>RE_ENABLE:</b> RE Enable control. The 'RE Enable' register bit is used to control assertion and de-assertion of 're' signal. - 0: De-assert 're' signal - 1: Assert 're' signal

#### 14.17.5.18 DET — Offset 482080B8h

Driver Output Enable Timing Register - The Driver Output Enable Timing Register (DET) is used to control the DE assertion and de-assertion timings of 'de' signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482080B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	00h RW	<b>DE_DE_ASSERTION_TIME:</b> Driver Enable de-assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the end of stop bit on the sout to the falling edge of Driver output enable signal.
15:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>DE_ASSERTION_TIME:</b> Driver Enable assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the assertion of rising edge of Driver output enable signal to serial transmit enable. Any data in transmit buffer, will start on serial output (sout) after the transmit enable.

#### 14.17.5.19 TAT — Offset 482080BCh

TurnAround Timing Register - The TurnAround Timing Register (TAT) is used to hold the turnaround time between switching of 're' and 'de' signals. This register is only valid when the DW\_apb\_uart is configured to have the RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482080BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>RE_TO_DE:</b> Receiver Enable to Driver Enable TurnAround time. Turnaround time (in terms of serial clock) for RE De-assertion to DE assertion. Note: - If the DE assertion time in the DET register is 0, then the actual value is the programmed value + 3. - If the DE assertion time in the DET register is 1, then the actual value is the programmed value + 2. - If the DE assertion time in the DET register is greater than 1, then the actual value is the programmed value + 1.
15:0	0000h RW	<b>DE_TO_RE:</b> Driver Enable to Receiver Enable TurnAround time. Turnaround time (in terms of serial clock) for DE De-assertion to RE assertion. Note: The actual time is the programmed value + 1.

#### 14.17.5.20 DLF – Offset 482080C0h

Divisor Latch Fraction Register - This register is only valid when the DW\_apb\_uart is configured to have Fractional Baud rate Divisor implemented (FRACTIONAL\_BAUD\_DIVISOR\_EN = ENABLED). If Fractional Baud rate divisor is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	482080C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>DLF:</b> Fractional part of divisor. The fractional value is added to integer value set by DLH, DLL. Fractional value is determined by (Divisor Fraction value)/(2^DLF_SIZE). For information on DLF values to be programmed for DLF_SIZE=4, see the 'Fractional Baud Rate Support' section in the DW_apb_uart Databook.

#### 14.17.5.21 RAR – Offset 482080C4h

Receive Address Register - Receive Address Register

Type	Size	Offset	Default
MMIO	32 bit	482080C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RAR:</b> This is an address matching register during receive mode. If the 9-th bit is set in the incoming character then the remaining 8-bits will be checked against this register value. If the match happens then sub-sequent characters with 9-th bit set to 0 will be treated as data byte until the next address byte is received. Note: - This register is applicable only when 'ADDR_MATCH'(LCR_EXT[1] and 'DLS_E' (LCR_EXT[0]) bits are set to 1. - If UART_16550_COMPATIBLE is configured to 0, then RAR should be programmed only when UART is not busy. - If UART_16550_COMPATIBLE is configured to 0, then RAR can be programmed at any point of the time. However, user must not change this register value when any receive is in progress.

#### 14.17.5.22 TAR — Offset 482080C8h

Transmit Address Register - Transmit Address Register

Type	Size	Offset	Default
MMIO	32 bit	482080C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>TAR:</b> This is an address matching register during transmit mode. If DLS_E (LCR_EXT[0]) bit is enabled, then DW_apb_uart will send the 9-bit character with 9-th bit set to 1 and remaining 8-bit address will be sent from this register provided 'SEND_ADDR' (LCR_EXT[2]) bit is set to 1. Note: - This register is used only to send the address. The normal data should be sent by programming THR register. - Once the address is started to send on the DW_apb_uart serial lane, then 'SEND_ADDR' bit will be auto-cleared by the hardware.

#### 14.17.5.23 LCR\_EXT — Offset 482080CCh

Line Extended Control Register - Line Extended Control Register

Type	Size	Offset	Default
MMIO	32 bit	482080CCh	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW/V	<b>TRANSMIT_MODE:</b> Transmit mode control bit. This bit is used to control the type of transmit mode during 9-bit data transfers. - 1: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding Register (STHR) are 9-bit wide. The user needs to ensure that the THR/STHR register is written correctly for address/data. Address: 9th bit is set to 1, Data : 9th bit is set to 0. Note: Transmit address register (TAR) is not applicable in this mode of operation. - 0: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding register (STHR) are 8-bit wide. The user needs to program the address into Transmit Address Register (TAR) and data into the THR/STHR register. SEND_ADDR bit is used as a control knob to indicate the DW_apb_uart on when to send the address.
2	0h RW/V	<b>SEND_ADDR:</b> Send address control bit. This bit is used as a control knob for the user to determine when to send the address during transmit mode. - 1 = 9-bit character will be transmitted with 9-th bit set to 1 and the remaining 8-bits will match to what is being programmed in 'Transmit Address Register'. - 0 = 9-bit character will be transmitted with 9-th bit set to 0 and the remaining 8-bits will be taken from the TXFIFO which is programmed through 8-bit wide THR/STHR register. Note: - 1. This bit is auto-cleared by the hardware, after sending out the address character. User is not expected to program this bit to 0. - 2. This field is applicable only when DLS_E bit is set to 1 and TRANSMIT_MODE is set to 0.
1	0h RW/V	<b>ADDR_MATCH:</b> Address Match Mode. This bit is used to enable the address match feature during receive. - 1 = Address match mode; DW_apb_uart will wait until the incoming character with 9-th bit set to 1. And further checks to see if the address matches with what is programmed in 'Receive Address Match Register'. If match is found, then subsequent characters will be treated as valid data and DW_apb_uart starts receiving data. - 0 = Normal mode; DW_apb_uart will start to receive the data and 9-bit character will be formed and written into the receive RXFIFO. User is responsible to read the data and differentiate b/n address and data. Note: This field is applicable only when DLS_E is set to 1.
0	0h RW/V	<b>DLS_E:</b> Extension for DLS. This bit is used to enable 9-bit data for transmit and receive transfers.

#### 14.17.5.24 CPR – Offset 482080F4h

Component Parameter Register - Component Parameter Register. This register is valid only when UART\_ADD\_ENCODED\_PARAMS = 1. If the UART\_ADD\_ENCODED\_PARAMS parameter is not set, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482080F4h	00043532h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	04h RO/V	<b>FIFO_MODE:</b> Encoding of FIFO_MODE configuration parameter value.
15:14	0h RO	<b>Reserved</b>
13	1h RO/V	<b>DMA_EXTRA:</b> Encoding of DMA_EXTRA configuration parameter value.
12	1h RO/V	<b>UART_ADD_ENCODED_PARAMS:</b> Encoding of UART_ADD_ENCODED_PARAMS configuration parameter value.
11	0h RO/V	<b>SHADOW:</b> Encoding of SHADOW configuration parameter value.
10	1h RO/V	<b>FIFO_STAT:</b> Encoding of FIFO_STAT configuration parameter value.
9	0h RO/V	<b>FIFO_ACCESS:</b> Encoding of FIFO_ACCESS configuration parameter value.
8	1h RO/V	<b>ADDITIONAL_FEAT:</b> Encoding of ADDITIONAL_FEATURES configuration parameter value.
7	0h RO/V	<b>SIR_LP_MODE:</b> Encoding of SIR_LP_MODE configuration parameter value.
6	0h RO/V	<b>SIR_MODE:</b> Encoding of SIR_MODE configuration parameter value.
5	1h RO/V	<b>THRE_MODE:</b> Encoding of THRE_MODE configuration parameter value.
4	1h RO/V	<b>AFCE_MODE:</b> Encoding of AFCE_MODE configuration parameter value.
3:2	0h RO	<b>Reserved</b>
1:0	2h RO/V	<b>APB_DATA_WIDTH:</b> Encoding of APB_DATA_WIDTH configuration parameter value.

#### 14.17.5.25 UCV – Offset 482080F8h

UART Component Version - UCV register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482080F8h	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>UART_COMPONENT_VERSION:</b> ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*

#### 14.17.5.26 CTR – Offset 482080FCh

Component Type Register - CTR is register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	482080FCh	44570110h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570110h RO/V	<b>PERIPHERAL_ID:</b> This register contains the peripherals identification code.

## 14.17.6 UART\_5 Registers Summary

**Table 14-35. Summary of UART\_5 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
4820A000h	4	RBR	00000000h
4820A004h	4	IER	00000000h
4820A008h	4	IIR	00000001h
4820A00Ch	4	LCR	00000000h
4820A010h	4	MCR	00000000h
4820A014h	4	LSR	00000060h
4820A018h	4	MSR	00000000h
4820A01Ch	4	SCR	00000000h
4820A070h	4	FAR	00000000h
4820A07Ch	4	USR	00000006h
4820A080h	4	TFI	00000000h
4820A084h	4	RFL	00000000h
4820A0A4h	4	HTX	00000000h
4820A0A8h	4	DMASA	00000000h
4820A0ACh	4	TCR	00000006h
4820A0B0h	4	DE_EN	00000000h
4820A0B4h	4	RE_EN	00000000h
4820A0B8h	4	DET	00000000h
4820A0BCh	4	TAT	00000000h
4820A0C0h	4	DLF	00000000h
4820A0C4h	4	RAR	00000000h
4820A0C8h	4	TAR	00000000h
4820A0CCh	4	LCR_EXT	00000000h
4820A0F4h	4	CPR	00043532h
4820A0F8h	4	UCV	3430322Ah
4820A0FCh	4	CTR	44570110h

### 14.17.6.1 RBR — Offset 4820A000h

Receive Buffer Register - Receive Buffer Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	4820A000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8:0	000h RO/V	<b>RBR:</b> Receive Buffer Register. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to 0), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an over-run error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to 1), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost and an over-run error occurs. Note: When UART_9BIT_DATA_EN=0, this field width is 8. When UART_9BIT_DATA_EN=1, this field width is 9.

#### 14.17.6.2 IER — Offset 4820A004h

Interrupt Enable Register - Interrupt Enable Register. This register can be accessed only when the DLAB bit (LCR[7]) is cleared.

Type	Size	Offset	Default
MMIO	32 bit	4820A004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>PTIME:</b> Programmable THRE Interrupt Mode Enable. Writeable only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt.
6:5	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>ELCOLR:</b> Interrupt Enable Register: ELCOLR, this bit controls the method for clearing the status in the LSR register. This is applicable only for Overrun Error, Parity Error, Framing Error, and Break Interrupt status bits. 0 = LSR status bits are cleared either on reading Rx FIFO (RBR Read) or On reading LSR register. 1 = LSR status bits are cleared only on reading LSR register. Writeable only when LSR_STATUS_CLEAR == Enabled, always readable.
3	0h RW	<b>EDSSI:</b> Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt.
2	0h RW	<b>ELSI:</b> Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt.
1	0h RW	<b>ETBEI:</b> Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt.
0	0h RW	<b>ERBFI:</b> Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFO's enabled). These are the second highest priority interrupts.

### 14.17.6.3 IIR — Offset 4820A008h

Interrupt Identification Register - Interrupt Identification Register

Type	Size	Offset	Default
MMIO	32 bit	4820A008h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:6	0h RO/V	<b>FIFOE:</b> FIFOs Enabled (or FIFOE). This is used to indicate whether the FIFOs are enabled or disabled.
5:4	0h RO	<b>Reserved</b>
3:0	1h RO/V	<b>IID:</b> Interrupt ID (or IID). This indicates the highest priority pending interrupt which can be one of the following types specified in Values. For information on several levels into which the interrupt priorities are split into, see the 'Interrupts' section in the DW_apb_uart Databook. Note: an interrupt of type 0111 (busy detect) will never get indicated if UART_16550_COMPATIBLE == YES in coreConsultant. Bit 3 indicates an interrupt can only occur when the FIFOs are enabled and used to distinguish a Character Timeout condition interrupt.

#### 14.17.6.4 LCR — Offset 4820A00Ch

Line Control Register - Line Control Register

Type	Size	Offset	Default
MMIO	32 bit	4820A00Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RW	<b>DLAB:</b> Divisor Latch Access Bit. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH/LPDLH and LPDLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers.
6	0h RW	<b>BC:</b> Break Control Bit. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.
5	0h RW	<b>SP:</b> Stick Parity. If UART_16550_COMPATIBLE = NO, then writeable only when UART is not busy (USR[0] is 0); otherwise always writable and always readable. This bit is used to force parity value. When PEN, EPS and Stick Parity are set to 1, the parity bit is transmitted and checked as logic 0. If PEN and Stick Parity are set to 1 and EPS is a logic 0, then parity bit is transmitted and checked as a logic 1. If this bit is set to 0, Stick Parity is disabled.
4	0h RW	<b>EPS:</b> Even Parity Select. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic '1's is transmitted or checked. If set to zero, an odd number of logic '1's is transmitted or checked.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	<b>PEN:</b> Parity Enable . If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively.
2	0h RW	<b>STOP:</b> Number of stop bits. If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. This is used to select the number of stop bits per character that the peripheral will transmit and receive. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected the receiver will only check the first stop bit. Note: NOTE: The STOP bit duration implemented by DW_apb_uart may appear longer due to idle time inserted between characters for some configurations and baud clock divisor values in the transmit direction; for details on idle time between transmitted transfers, refer to 'Back-to-Back Character Stream Transmission' section in data book.
1:0	0h RW	<b>DLS:</b> Data Length Select (or CLS as used in legacy). If UART_16550_COMPATIBLE == NO then, writeable only when UART is not busy (USR[0] is zero), otherwise always writable and always readable. When DLS_E in LCR_EXT is set to 0, this register is used to select the number of data bits per character that the peripheral will transmit and receive.

#### 14.17.6.5 MCR — Offset 4820A010h

Modem Control Register - Modem Control Register

Type	Size	Offset	Default
MMIO	32 bit	4820A010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>SIRE:</b> SIR Mode Enable . Writeable only when SIR_MODE == Enabled, always readable. This is used to enable/ disable the IrDA SIR Mode features as described in section 'IrDA 1.0 SIR Protocol' in the databook. Note: To enable SIR mode, write the appropriate value to the MCR register before writing to the LCR register. For details of the recommended programming sequence, refer to 'Programing Examples' section of data book.
5	0h RW	<b>AFCE:</b> Auto Flow Control Enable . Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in section 'Auto Flow Control' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>LOOPBACK:</b> LoopBack Bit . This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled OR NOT active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.
3	0h RW	<b>OUT2:</b> OUT2 . This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n. Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.
2	0h RW	<b>OUT1:</b> OUT1 . This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n. Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.
1	0h RW	<b>RTS:</b> Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFO's enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal will be de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input.
0	0h RW	<b>DTR:</b> Data Terminal Ready. This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n. The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input.

#### 14.17.6.6 LSR — Offset 4820A014h

Line Status Register - Line Status Register

Type	Size	Offset	Default
MMIO	32 bit	4820A014h	00000060h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RO/V	<b>ADDR_RCVD:</b> Address Received Bit. If 9Bit data mode (LCR_EXT[0]=1) is enabled, this bit is used to indicate the 9th bit of the receive data is set to 1. This bit can also be used to indicate whether the incoming character is address or data. - 1 = Indicates the character is address. - 0 = Indicates the character is data. In the FIFO mode, since the 9th bit is associated with a character received, it is revealed when the character with the 9th bit set to 1 is at the top of the FIFO. Reading the LSR clears the 9BIT. Note: User needs to ensure that interrupt gets cleared (reading LSR register) before the next address byte arrives. If there is a delay in clearing the interrupt, then Software will not be able to distinguish between multiple address related interrupt.
7	0h RO/V	<b>RFE:</b> Receiver FIFO Error bit. This bit is only relevant when FIFO_MODE != NONE AND FIFO's are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.
6	1h RO/V	<b>TEM:</b> Transmitter Empty bit. If in FIFO mode (FIFO_MODE != NONE) and FIFO's enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in the non-FIFO mode or FIFO's are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.
5	1h RO/V	<b>THRE:</b> Transmit Holding Register Empty bit. If THRE_MODE_USER = Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Programmable THRE interrupt mode operation is described in detail in section 'Programmable THRE Interrupt' in data book.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>BI:</b> Break Interrupt bit. This is used to indicate the detection of a break sequence on the serial input data. If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the BI bit (if LSR_STATUS_CLEAR==0). In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. Note: If a FIFO is full when a break condition is received, a FIFO overrun occurs. The break condition and all the information associated with it-parity and framing errors-is discarded; any information that a break character was received is lost.
3	0h RO/V	<b>FE:</b> Framing Error bit. This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs the UART will try resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). This happens because the break character implicitly generates a framing error by holding the sin input to logic 0 for longer than the duration of a character. Reading the LSR clears the FE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the FE bit (if LSR_STATUS_CLEAR==0).
2	0h RO/V	<b>PE:</b> Parity Error bit. This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) will be set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). In this situation, the Parity Error bit is set if parity generation and detection is enabled (LCR[3]=1) and the parity is set to odd (LCR[4]=0). Reading the LSR clears the PE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the PE bit (if LSR_STATUS_CLEAR==0).
1	0h RO/V	<b>OE:</b> Overrun error bit. This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. Reading the LSR clears the OE bit (if LSR_STATUS_CLEAR==1) Or Reading the LSR or RBR clears the OE bit (if LSR_STATUS_CLEAR==0).
0	0h RO/V	<b>DR:</b> Data Ready bit. This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. This bit is cleared when the RBR is read in the non-FIFO mode, or when the receiver FIFO is empty, in the FIFO mode.

#### 14.17.6.7 MSR — Offset 4820A018h

Modem Status Register - Whenever bits 0, 1, 2 or 3 is set to logic one, to indicate a change on the modem control inputs, a modem status interrupt will be generated if enabled via the IER regardless of when the change occurred. The bits (bits 0, 1, 3) can be set after a reset-even though their respective modem signals are inactive-because

the synchronized version of the modem signals have a reset value of 0 and change to value 1 after reset. To prevent unwanted interrupts due to this change, a read of the MSR register can be performed after reset.

Type	Size	Offset	Default
MMIO	32 bit	4820A018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7	0h RO/V	<b>DCD:</b> Data Carrier Detect. This is used to indicate the current state of the modem control line dcd_n. That is this bit is the complement dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2).
6	0h RO/V	<b>RI:</b> Ring Indicator. This is used to indicate the current state of the modem control line ri_n. That is this bit is the complement ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1).
5	0h RO/V	<b>DSR:</b> Data Set Ready. This is used to indicate the current state of the modem control line dsr_n. That is this bit is the complement dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR).
4	0h RO/V	<b>CTS:</b> Clear to Send. This is used to indicate the current state of the modem control line cts_n. That is, this bit is the complement cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. In Loopback Mode (MCR[4] set to one), CTS is the same as MCR[1] (RTS).
3	0h RO/V	<b>DDCD:</b> Delta Data Carrier Detect. This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] set to one), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit will get set when the reset is removed if the dcd_n signal remains asserted.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO/V	<b>TERI:</b> Trailing Edge of Ring Indicator. This is used to indicate that a change on the input ri_n (from an active low, to an inactive high state) has occurred since the last time the MSR was read. Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] set to one), TERI reflects when MCR[2] (Out1) has changed state from a high to a low.
1	0h RO/V	<b>DDSR:</b> Delta Data Set Ready. This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] set to one), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit will get set when the reset is removed if the dsr_n signal remains asserted.
0	0h RO/V	<b>DCTS:</b> Delta Clear to Send. This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] set to one), DCTS reflects changes on MCR[1] (RTS). Note, if the DCTS bit is not set and the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit will get set when the reset is removed if the cts_n signal remains asserted.

#### 14.17.6.8 SCR — Offset 4820A01Ch

Scratchpad Register - Scratchpad Register

Type	Size	Offset	Default
MMIO	32 bit	4820A01Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>SCR:</b> This register is for programmers to use as a temporary storage space. It has no defined purpose in the DW_apb_uart.

#### 14.17.6.9 FAR — Offset 4820A070h

FIFO Access Register - FIFO Access Register

Type	Size	Offset	Default
MMIO	32 bit	4820A070h	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>FAR:</b> Writes will have no effect when FIFO_ACCESS == No, always readable. This register is used to enable a FIFO access mode for testing, so that the receive FIFO can be written by the master and the transmit FIFO can be read by the master when FIFO's are implemented and enabled. When FIFOs are not implemented or not enabled it allows the RBR to be written by the master and the THR to be read by the master. Note, that when the FIFO access mode is enabled/disabled, the control portion of the receive FIFO and transmit FIFO is reset and the FIFO's are treated as empty.

#### 14.17.6.10 USR — Offset 4820A07Ch

UART Status register - UART Status register.

Type	Size	Offset	Default
MMIO	32 bit	4820A07Ch	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO/V	<b>RFF:</b> Receive FIFO Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO is completely full. That is: This bit is cleared when the RX FIFO is no longer full.
3	0h RO/V	<b>RFNE:</b> Receive FIFO Not Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO contains one or more entries. This bit is cleared when the RX FIFO is empty.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	<b>TFE:</b> Transmit FIFO Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is completely empty. This bit is cleared when the TX FIFO is no longer empty.
1	1h RO/V	<b>TFNF:</b> Transmit FIFO Not Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is not full. This bit is cleared when the TX FIFO is full.
0	0h RO	<b>Reserved</b>

#### 14.17.6.11 TFL — Offset 4820A080h

Transmit FIFO Level - TFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	4820A080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>TFL:</b> Transmit FIFO Level. This indicates the number of data entries in the transmit FIFO.

#### 14.17.6.12 RFL — Offset 4820A084h

Receive FIFO Level - RFL register is valid only when the DW\_apb\_uart is configured to have additional FIFO status registers implemented (FIFO\_STAT = YES). If status registers are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	4820A084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	<b>Reserved</b>
6:0	00h RO/V	<b>RFL:</b> Receive FIFO Level. This indicates the number of data entries in the receive FIFO.

#### 14.17.6.13 HTX — Offset 4820A0A4h

Halt TX - Halt TX

Type	Size	Offset	Default
MMIO	32 bit	4820A0A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>HTX:</b> Halt TX. Writes will have no effect when FIFO_MODE == NONE, always readable. This register is use to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFO's are implemented and enabled. Note, if FIFO's are implemented and not enabled the setting of the halt TX register will have no effect on operation.

#### 14.17.6.14 DMASA — Offset 4820A0A8h

DMA Software Acknowledge Register - DMA Software Acknowledge Register

Type	Size	Offset	Default
MMIO	32 bit	4820A0A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h WO	<b>DMASA:</b> DMA Software Acknowledge. Writes will have no effect when DMA_EXTRA == No. This register is use to perform DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This will cause the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing' and it is not necessary to clear this bit.

#### 14.17.6.15 TCR – Offset 4820A0ACh

Transceiver Control Register - This register is used to enable or disable RS485 mode and also control the polarity values for Driven enable (de) and Receiver Enable (re) signals. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address returns zero.

Type	Size	Offset	Default
MMIO	32 bit	4820A0ACh	00000006h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:3	0h RW	<b>XFER_MODE:</b> Transfer Mode. - 0: In this mode, transmit and receive can happen simultaneously. The user can enable DE_EN, RE_EN at any point of time. Turn around timing as programmed in the TAT register is not applicable in this mode. - 1: In this mode, DE and RE are mutually exclusive. Either DE or RE only one of them is expected to be enabled through programming. Hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. For transmission Hardware will wait if it is in middle of receiving any transfer, before it starts transmitting. - 2: In this mode, DE and RE are mutually exclusive. Once DE_EN/RE_EN is programmed - by default 're' will be enabled and DW_apb_uart controller will be ready to receive. If the user programs the TX FIFO with the data then DW_apb_uart, after ensuring no receive is in progress, disable 're' and enable 'de' signal. Once the TX FIFO becomes empty, 're' signal gets enabled and 'de' signal will be disabled. In this mode of operation hardware will consider the Turn Around timings which are programmed in the TAT register while switching from RE to DE or DE to RE. In this mode, 'de' and 're' signals are strictly complementary to each other.
2	1h RW	<b>DE_POL:</b> Driver Enable Polarity. - 1: DE signal is active high - 0: DE signal is active low
1	1h RW	<b>RE_POL:</b> Receiver Enable Polarity. - 1: RE signal is active high - 0: RE signal is active low
0	0h RW	<b>RS485_EN:</b> RS485 Transfer Enable. - 0 : In this mode, the transfers are still in the RS232 mode. All other fields in this register are reserved and register DE_EN/RE_EN/TAT are also reserved. - 1 : In this mode, the transfers will happen in RS485 mode. All other fields of this register are applicable.

#### 14.17.6.16 DE\_EN – Offset 4820A0B0h

Driver Output Enable Register - The Driver Output Enable Register (DE\_EN) is used to control the assertion and de-assertion of the DE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	4820A0B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>DE_ENABLE:</b> DE Enable control. The 'DE Enable' register bit is used to control assertion and de-assertion of 'de' signal. - 0: De-assert 'de' signal - 1: Assert 'de' signal

#### 14.17.6.17 RE\_EN — Offset 4820A0B4h

Receiver Output Enable Register - The Receiver Output Enable Register (RE\_EN) is used to control the assertion and de-assertion of the RE signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If the RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	4820A0B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>RE_ENABLE:</b> RE Enable control. The 'RE Enable' register bit is used to control assertion and de-assertion of 're' signal. - 0: De-assert 're' signal - 1: Assert 're' signal

#### 14.17.6.18 DET — Offset 4820A0B8h

Driver Output Enable Timing Register - The Driver Output Enable Timing Register (DET) is used to control the DE assertion and de-assertion timings of 'de' signal. This register is only valid when the DW\_apb\_uart is configured to have RS485 interface implemented (UART\_RS485\_INTERFACE = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	4820A0B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	00h RW	<b>DE_DE_ASSERTION_TIME:</b> Driver Enable de-assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the end of stop bit on the sout to the falling edge of Driver output enable signal.
15:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>DE_ASSERTION_TIME:</b> Driver Enable assertion time. This field controls the amount of time (in terms of number of serial clock periods) between the assertion of rising edge of Driver output enable signal to serial transmit enable. Any data in transmit buffer, will start on serial output (sout) after the transmit enable.

#### 14.17.6.19 TAT — Offset 4820A0BCh

TurnAround Timing Register - The TurnAround Timing Register (TAT) is used to hold the turnaround time between switching of 're' and 'de' signals. This register is only valid when the DW\_apb\_uart is configured to have the RS485 interface implemented (UART\_RS485\_INTERFACE\_EN = ENABLED). If RS485 interface is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	4820A0BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>RE_TO_DE:</b> Receiver Enable to Driver Enable TurnAround time. Turnaround time (in terms of serial clock) for RE De-assertion to DE assertion. Note: - If the DE assertion time in the DET register is 0, then the actual value is the programmed value + 3. - If the DE assertion time in the DET register is 1, then the actual value is the programmed value + 2. - If the DE assertion time in the DET register is greater than 1, then the actual value is the programmed value + 1.
15:0	0000h RW	<b>DE_TO_RE:</b> Driver Enable to Receiver Enable TurnAround time. Turnaround time (in terms of serial clock) for DE De-assertion to RE assertion. Note: The actual time is the programmed value + 1.

#### 14.17.6.20 DLF – Offset 4820A0C0h

Divisor Latch Fraction Register - This register is only valid when the DW\_apb\_uart is configured to have Fractional Baud rate Divisor implemented (FRACTIONAL\_BAUD\_DIVISOR\_EN = ENABLED). If Fractional Baud rate divisor is not implemented, this register does not exist and reading from this register address will return zero.

Type	Size	Offset	Default
MMIO	32 bit	4820A0C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>DLF:</b> Fractional part of divisor. The fractional value is added to integer value set by DLH, DLL. Fractional value is determined by (Divisor Fraction value)/(2^DLF_SIZE). For information on DLF values to be programmed for DLF_SIZE=4, see the 'Fractional Baud Rate Support' section in the DW_apb_uart Databook.

#### 14.17.6.21 RAR – Offset 4820A0C4h

Receive Address Register - Receive Address Register

Type	Size	Offset	Default
MMIO	32 bit	4820A0C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>RAR:</b> This is an address matching register during receive mode. If the 9-th bit is set in the incoming character then the remaining 8-bits will be checked against this register value. If the match happens then sub-sequent characters with 9-th bit set to 0 will be treated as data byte until the next address byte is received. Note: - This register is applicable only when 'ADDR_MATCH'(LCR_EXT[1] and 'DLS_E' (LCR_EXT[0]) bits are set to 1. - If UART_16550_COMPATIBLE is configured to 0, then RAR should be programmed only when UART is not busy. - If UART_16550_COMPATIBLE is configured to 0, then RAR can be programmed at any point of the time. However, user must not change this register value when any receive is in progress.

#### 14.17.6.22 TAR — Offset 4820A0C8h

Transmit Address Register - Transmit Address Register

Type	Size	Offset	Default
MMIO	32 bit	4820A0C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>TAR:</b> This is an address matching register during transmit mode. If DLS_E (LCR_EXT[0]) bit is enabled, then DW_apb_uart will send the 9-bit character with 9-th bit set to 1 and remaining 8-bit address will be sent from this register provided 'SEND_ADDR' (LCR_EXT[2]) bit is set to 1. Note: - This register is used only to send the address. The normal data should be sent by programming THR register. - Once the address is started to send on the DW_apb_uart serial lane, then 'SEND_ADDR' bit will be auto-cleared by the hardware.

#### 14.17.6.23 LCR\_EXT — Offset 4820A0CCh

Line Extended Control Register - Line Extended Control Register

Type	Size	Offset	Default
MMIO	32 bit	4820A0CCh	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW/V	<b>TRANSMIT_MODE:</b> Transmit mode control bit. This bit is used to control the type of transmit mode during 9-bit data transfers. - 1: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding Register (STHR) are 9-bit wide. The user needs to ensure that the THR/STHR register is written correctly for address/data. Address: 9th bit is set to 1, Data : 9th bit is set to 0. Note: Transmit address register (TAR) is not applicable in this mode of operation. - 0: In this mode of operation, Transmit Holding Register (THR) and Shadow Transmit Holding register (STHR) are 8-bit wide. The user needs to program the address into Transmit Address Register (TAR) and data into the THR/STHR register. SEND_ADDR bit is used as a control knob to indicate the DW_apb_uart on when to send the address.
2	0h RW/V	<b>SEND_ADDR:</b> Send address control bit. This bit is used as a control knob for the user to determine when to send the address during transmit mode. - 1 = 9-bit character will be transmitted with 9-th bit set to 1 and the remaining 8-bits will match to what is being programmed in 'Transmit Address Register'. - 0 = 9-bit character will be transmitted with 9-th bit set to 0 and the remaining 8-bits will be taken from the TXFIFO which is programmed through 8-bit wide THR/STHR register. Note: - 1. This bit is auto-cleared by the hardware, after sending out the address character. User is not expected to program this bit to 0. - 2. This field is applicable only when DLS_E bit is set to 1 and TRANSMIT_MODE is set to 0.
1	0h RW/V	<b>ADDR_MATCH:</b> Address Match Mode. This bit is used to enable the address match feature during receive. - 1 = Address match mode; DW_apb_uart will wait until the incoming character with 9-th bit set to 1. And further checks to see if the address matches with what is programmed in 'Receive Address Match Register'. If match is found, then subsequent characters will be treated as valid data and DW_apb_uart starts receiving data. - 0 = Normal mode; DW_apb_uart will start to receive the data and 9-bit character will be formed and written into the receive RXFIFO. User is responsible to read the data and differentiate b/n address and data. Note: This field is applicable only when DLS_E is set to 1.
0	0h RW/V	<b>DLS_E:</b> Extension for DLS. This bit is used to enable 9-bit data for transmit and receive transfers.

#### 14.17.6.24 CPR – Offset 4820A0F4h

Component Parameter Register - Component Parameter Register. This register is valid only when UART\_ADD\_ENCODED\_PARAMS = 1. If the UART\_ADD\_ENCODED\_PARAMS parameter is not set, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	4820A0F4h	00043532h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	04h RO/V	<b>FIFO_MODE:</b> Encoding of FIFO_MODE configuration parameter value.
15:14	0h RO	<b>Reserved</b>
13	1h RO/V	<b>DMA_EXTRA:</b> Encoding of DMA_EXTRA configuration parameter value.
12	1h RO/V	<b>UART_ADD_ENCODED_PARAMS:</b> Encoding of UART_ADD_ENCODED_PARAMS configuration parameter value.
11	0h RO/V	<b>SHADOW:</b> Encoding of SHADOW configuration parameter value.
10	1h RO/V	<b>FIFO_STAT:</b> Encoding of FIFO_STAT configuration parameter value.
9	0h RO/V	<b>FIFO_ACCESS:</b> Encoding of FIFO_ACCESS configuration parameter value.
8	1h RO/V	<b>ADDITIONAL_FEAT:</b> Encoding of ADDITIONAL_FEATURES configuration parameter value.
7	0h RO/V	<b>SIR_LP_MODE:</b> Encoding of SIR_LP_MODE configuration parameter value.
6	0h RO/V	<b>SIR_MODE:</b> Encoding of SIR_MODE configuration parameter value.
5	1h RO/V	<b>THRE_MODE:</b> Encoding of THRE_MODE configuration parameter value.
4	1h RO/V	<b>AFCE_MODE:</b> Encoding of AFCE_MODE configuration parameter value.
3:2	0h RO	<b>Reserved</b>
1:0	2h RO/V	<b>APB_DATA_WIDTH:</b> Encoding of APB_DATA_WIDTH configuration parameter value.

#### 14.17.6.25 UCV – Offset 4820A0F8h

UART Component Version - UCV register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	4820A0F8h	3430322Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3430322Ah RO/V	<b>UART_COMPONENT_VERSION:</b> ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01*

#### 14.17.6.26 CTR – Offset 4820A0FCh

Component Type Register - CTR is register is valid only when the DW\_apb\_uart is configured to have additional features implemented (ADDITIONAL\_FEATURES = YES). If additional features are not implemented, this register does not exist and reading from this register address returns 0.

Type	Size	Offset	Default
MMIO	32 bit	4820A0FCh	44570110h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570110h RO/V	<b>PERIPHERAL_ID:</b> This register contains the peripherals identification code.

## 14.18 I2S Interface Registers

There are two I2S Interface registers:-

- I2S\_0 Registers
- I2S\_1 Registers

I2S Interface Registers	Address Offset	Table
I2S_0	48300000h - 48300040h	Table 13-36
I2S_1	48302000h - 48302040h	Table 13-37

### 14.18.1 I2S\_0 Registers Summary

**Table 14-36. Summary of I2S\_0 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48300000h	4	I2S-SC Control (I2S_CTRL)	000001B8h
48300004h	4	I2S Full Duplex Mode Receiver Control (I2S_CTRL_FDR)	00000010h
48300008h	4	Transceiver Sample Resolution (I2S_SRES)	00000000h
4830000Ch	4	Full Duplex Mode Receive Samples Resolution (I2S_SRES_FDR)	00000000h
48300010h	4	Transceiver Sample Rate (I2S_SRATE)	00000000h
48300014h	4	I2S-SC Status Flags (I2S_STAT)	0003000Ch
48300018h	4	FIFO Using Level(Read Only) (FIFO_LEVEL)	00000000h
4830001Ch	4	FIFO Almost Empty Level (FIFO_AEMPTY)	00000000h
48300020h	4	FIFO Almost Full Level (FIFO_AFULL)	0000001Fh
48300024h	4	Full Duplex Mode Receiver FIFO Using Level(Read Only) (FIFO_LEVEL_FDR)	00000000h
48300028h	4	Full Duplex Mode Receiver FIFO Almost Empty Level (FIFO_AEMPTY_FDR)	00000000h
4830002Ch	4	Full Duplex Mode Receiver FIFO Almost Full Level (FIFO_AFULL_FDR)	0000001Fh
48300030h	4	Time Division Multiplexing Control (TDM_CTRL)	FFFF0000h
48300034h	4	Time Division Multiplexing Full Duplex Mode Channels Direction (TDM_FD_DIR)	0000FFFFh
48300040h	4	TX/RX FIFO (FIFO)	00000000h

#### 14.18.1.1 I2S-SC Control (I2S\_CTRL) — Offset 48300000h

I2S-SC Control Register After end of reset bit sfr\_RST triggers to 1 and bit fifo\_RST triggers to 1. Therefore register value after end of reset is 000001B8.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300000h	000001B8h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>Full-Duplex Mode Receiver Samples Resolution (FULL_DUPLEX):</b> Full-duplex mode enable bit. If HIGH transmitter and receiver data units work simultaneously, otherwise only transmitter or receiver is enable in dependent to dir_cfg bit (I2S_CTRL[1]).
30	0h RW	<b>FIFO Almost Full Mask Register (FIFO_AFULL_MASK):</b> Bit masking interrupt request generation after FIFO becomes almost full. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
29	0h RW	<b>FIFO Full Mask Register (FIFO_FULL_MASK):</b> Bit masking interrupt request generation after FIFO becomes full. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
28	0h RW	<b>FIFO Almost Empty Mask Register (FIFO_AEMPTY_MASK):</b> Bit masking interrupt request generation after FIFO becomes almost empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition. Sampled on the rising edge of the clock.
27	0h RW	<b>FIFO Empty Mask Register (FIFO_EMPTY_MASK):</b> Bit masking interrupt request generation after FIFO becomes empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition. Sampled on the rising edge of the clock.
26	0h RW	<b>I2s Mask Register (I2S_MASK):</b> Bit masking interrupt request generation after underrun/overrun condition occurrence in I2S-SC transceiver. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for underrun event interrupt. Sampled on the rising edge of the clock.
25	0h RW	<b>Interrupt Mask Register (INTREQ_MASK):</b> Bit masking all interrupt requests. When LOW all interrupts are masked, when HIGH interrupts use individual masks. Sampled on the rising edge of the clock.
24	0h RW	<b>Transceiver Clock Enable. (I2S_STB):</b> Transceiver clock enable. When LOW the clk_i2s clock is enabled, else clock is disabled. Sampled on the rising edge of the clock.
23	0h RW	<b>Audio Data Sample Alignment At Host Data Bus. (HOST_DATA_ALIGN):</b> Audio data sample alignment at host data bus. When LOW the audio sample data is aligned to the LSB at the host data bus. When HIGH the audio sample data is aligned to the MSB at host data bus. Sampled on the rising edge of the clock.
22	0h RW	<b>Audio Data Sample Arrangement In Audio Data Slot (DATA_ORDER):</b> Bit masking interrupt request generation after FIFO becomes almost empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
21	0h RW	<b>Audio Sample Alignment In Audio Data Time Slot (DATA_ALIGN):</b> Bit masking interrupt request generation after FIFO becomes empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.

Bit Range	Default & Access	Field Name (ID): Description
20:16	00h RW	<b>Audio Data Delay After WS Signal (DATA_WS_DEL):</b> Bit masking interrupt request generation after underrun/overrun condition occurrence in I2S-SC transceiver. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for underrun event interrupt.
15	0h RW	<b>The Word Select Signal Polarity Selection. (WS_POLAR):</b> Bit masking all interrupt requests. When LOW all interrupts are masked, when HIGH interrupts use individual masks.
14	0h RW	<b>The Continuous Serial Clock Active Edge. (SCK_POLAR):</b> Transceiver clock enable. When LOW the clk_i2s clock is enabled, else clock is disabled.
13	0h RW	<b>Mono/Stereo Audio Mode Selection (AUDIO_MODE):</b> Audio data sample alignment at host data bus. When LOW the audio sample data is aligned to the LSB at the host data bus. When HIGH the audio sample data is aligned to the MSB at host data bus.
12	0h RW	<b>Active Audio Channel In Mono Mode (MONO_MODE):</b> Active audio channel in mono mode. When LOW left audio channel is active. When HIGH right audio channel is active.
11:8	1h RW	<b>Word Select Signal (WS) Format. (WS_MODE):</b> Word select signal (WS) format. TDM mode is not active: Only bit 8 is relevant. If it is set to LOW (even value of ws_mode) WS signal have DSP audio interface specification format. If it is set to HIGH (odd value of ws_mode) WS signal have standard I2S audio interface specification format. TDM mode is active: When field equals 0 WS signal has DSP audio interface specification format, otherwise (ws_mode field equals the value from range 1 & CHN_NO-1) WS.
7:5	5h RW	<b>Audio Channel Time Slot Width (CHN_WIDTH):</b> Audio channel time slot width in I2S master or DSP/TDM master and slave modes. 0 8 SCK cycles per audio channel 1 12 SCK cycles per audio channel 2 16 SCK cycles per audio channel 3 18 SCK cycles per audio channel 4 20 SCK cycles per audio channel 5 24 SCK cycles per audio channel 6 28 SCK cycles per audio channel 7 32 SCK cycles per audio channel.
4	1h RW	<b>FIFO Reset (FIFO_RST):</b> FIFO reset. When LOW, FIFO pointer is reset to zero. Threshold levels for FIFO are unchanged. This bit is automatically set to HIGH after one clock cycle. In full-duplex mode this bit resets only transmitter FIFO.
3	1h RW	<b>SFR Block Synchronous Reset (SFR_RST):</b> SFR block synchronous reset. When LOW, all bits in SFR registers are reset to default values. This bit is automatically set to HIGH after one clock cycle.
2	0h RW	<b>Configuration Bit For Transceiver Synchronizing Unit (MS_CFG):</b> Configuration bit for transceiver synchronizing unit: 1 Master 0 Slave.
1	0h RW	<b>Direction Of Transmission (DIR_CFG):</b> 1 Transmitter 0 Receiver.
0	0h RW	<b>Enable Bit For I2S Transceiver (I2S_EN):</b> 1 enables transceiver 0 disables transceiver, causes synchronous reset signal, configuration SFR bits are unchanged .

#### 14.18.1.2 I2S Full Duplex Mode Receiver Control (I2S\_CTRL\_FDR) — Offset 48300004h

I2S Full Duplex Mode Receiver Control Register After end of reset bit FIFO\_rst triggers to 1. Therefore register value after end of reset is 00000010.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300004h	00000010h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved</b>
30	0h RW	<b>Full Duplex Almost FIFO Full Mask Register (RFIFO_AFULL_MASK):</b> Bit masking interrupt request generation after full-duplex mode receive FIFO becomes almost full. When LOW, masks generation of interrupt request.
29	0h RW	<b>Full Duplex FIFO Full Mask Register (RFIFO_FULL_MASK):</b> Bit masking interrupt request generation after full-duplex mode receive FIFO becomes full. When LOW, masks generation of interrupt request.
28	0h RW	<b>Full Duplex Almost FIFO Empty Mask Register (RFIFO_AEMPTY_MASK):</b> Bit masking interrupt request generation after full-duplex mode receive FIFO becomes almost empty. When LOW, masks generation of interrupt request.
27	0h RW	<b>Full Duplex FIFO Empty Mask Register (RFIFO_EMPTY_MASK):</b> Bit masking interrupt request generation after full-duplex mode receive FIFO becomes empty. When LOW, masks generation of interrupt request.
26	0h RW	<b>Full Duplex I2s_mask Register (RI2S_MASK):</b> Bit masking interrupt request generation after overrun condition occurrence in I2S-SC full-duplex mode receiver. When LOW, masks generation of interrupt request.
25:5	0h RO	<b>Reserved</b>
4	1h RW	<b>Full-Duplex Mode Receiver FIFO Reset. (FIFO_RST):</b> Full-duplex mode receiver FIFO reset. Active only in full-duplex mode. When '0', RFIFO pointer is reset to zero. Threshold levels for RFIFO are unchanged. The bit is automatically set to '1' after one clock cycle.
3:0	0h RO	<b>Reserved</b>

#### 14.18.1.3 Transceiver Sample Resolution (I2S\_SRES) — Offset 48300008h

Transceiver Sample Resolution.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	00h RW	<b>Samples Resolution. (RESOLUTION):</b> Samples resolution. When full-duplex mode is active, this value specifies resolution only for transmitted samples. Sampled on the rising edge of the clock. It simply should be assigned the value equal to the number of valid bits minus one, for example: 00000B sample resolution = 1 bit 11111B sample resolution = 32 bits.

#### 14.18.1.4 Full Duplex Mode Receive Samples Resolution (I2S\_SRES\_FDR) — Offset 483000Ch

Full Duplex Mode Receive Samples Resolution.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4830000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	00h RW	<b>I2s_sres Register - Samples Resolution (RESOLUTION):</b> Full-duplex mode receive samples resolution. When half-duplex mode is active this value is ignored. It simply should be assigned the value equal to the number of valid bits minus one, for example: 00000B sample resolution = 1 bit 11111B sample resolution = 32 bits.

#### 14.18.1.5 Transceiver Sample Rate (I2S\_SRATE) — Offset 48300010h

Transceiver Sample Rate.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19:0	00000h RW	<b>SAMPLE_RATE:</b> In general value of sample rate is the quotient of clk frequency and I2S rate [bit/s]. The value of sample rate is the higher the clk frequency is greater than I2S rate.

#### 14.18.1.6 I2S-SC Status Flags (I2S\_STAT) – Offset 48300014h

I2S-SC Status Flags Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300014h	0003000Ch

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19	0h RW	<b>Receive FIFO Almost Full Flag In Full-Duplex Mode (RFIFO_AFULL):</b> Receive FIFO almost full flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO becomes almost full (rising edge of almost full condition).
18	0h RW	<b>Receive FIFO Full Flag In Full-Duplex Mode (RFIFO_FULL):</b> Receive FIFO full flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO is full.
17	1h RW	<b>Receive FIFO Almost Empty Flag In Full-Duplex Mode (RFIFO_AEMPTY):</b> Receive FIFO almost empty flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO becomes almost empty (rising edge of almost empty condition).
16	1h RW	<b>Receive FIFO Empty Flag In Full-Duplex Mode (RFIFO_EMPTY):</b> Receive FIFO empty flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO is empty.
15:6	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	<b>FIFO Almost Full Flag (FIFO_AFULL):</b> FIFO almost full flag. Active HIGH. This flag is set to HIGH when FIFO becomes almost full (rising edge of almost full condition). When full-duplex mode is active, this bit is a flag only for transmitter FIFO almost full condition.
4	0h RW	<b>FIFO Full Flag (FIFO_FULL):</b> FIFO full flag. Active HIGH. This flag is set to HIGH when FIFO is full. When full-duplex mode is active, this bit is a flag only for transmitter FIFO full condition.
3	1h RW	<b>FIFO Almost Empty Flag (FIFO_AEMPTY):</b> FIFO almost empty flag. Active HIGH. This flag is set to HIGH when FIFO becomes almost empty (rising edge of almost empty condition). When full-duplex mode is active, this bit is a flag only for transmitter FIFO almost empty condition.
2	1h RW	<b>FIFO Empty Flag (FIFO_EMPTY):</b> FIFO empty flag. Active HIGH. This flag is set to HIGH when FIFO is empty. When full-duplex mode is active, this bit is a flag only for transmitter FIFO empty condition.
1	0h RW	<b>RDATA_OVRERR:</b> Indicates data overrun error for transceiver in receiver mode, active HIGH. Sampled and updated on the rising edge of the clock. Writing LOW value to this bit resets the transceiver and the FIFO. The transceiver configuration is preserved.
0	0h RW	<b>Full Duplex Mode Samples Resolution Register (TDATA_UNDERR):</b> Indicates data underrun event, active HIGH. This flag is set to HIGH when TX underrun arises (rising edge of underrun condition).

#### 14.18.1.7 FIFO Using Level(Read Only) (FIFO\_LEVEL) — Offset 48300018h

FIFO Using Level Register (read only).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RO	<b>FIFO Level Register (FIFO_LEVEL):</b> Indicates FIFO level. Updated on the rising edge of the clock. When full-duplex mode is active, this register holds value of the transmitter FIFO level. When half-duplex mode is active, this register holds value of the transmitter or receiver FIFO level in dependent to the transmit/receive direction mode.

#### 14.18.1.8 FIFO Almost Empty Level (FIFO\_AEMPTY) — Offset 4830001Ch

FIFO Almost Empty Level.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4830001Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	00h RW	<b>FIFO Almost Empty Threshold Level (AEMPTY_THRESHOLD):</b> Determines threshold for almost empty flag in the FIFO. When full-duplex mode is active, this register specifies an almost empty level of the transmitter FIFO level.

#### 14.18.1.9 FIFO Almost Full Level (FIFO\_AFULL) — Offset 48300020h

FIFO Almost Full Level.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300020h	0000001Fh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	1Fh RW	<b>FIFO Aempty Threshold Level (AFULL_THRESHOLD):</b> Determines threshold for almost full flag in the FIFO. When full-duplex mode is active, this register specifies an almost full level of the transmitter FIFO level.

#### 14.18.1.10 Full Duplex Mode Receiver FIFO Using Level(Read Only) (FIFO\_LEVEL\_FDR) — Offset 48300024h

Full Duplex Mode Receiver FIFO Using Level Register (read only).

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RO	<b>Full Duplex FIFO Level (RX_FIFO_LEVEL):</b> Full-duplex mode receive FIFO level.

#### 14.18.1.11 Full Duplex Mode Receiver FIFO Almost Empty Level (FIFO\_AEMPTY\_FDR) — Offset 48300028h

Full Duplex Mode Receiver FIFO Almost Empty Level.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300028h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	00h RW	<b>Full Duplex FIFO Almost Empty Level (AEMPTY_THRESHOLD):</b> Determines almost empty level in the receive FIFO in full-duplex mode.

#### 14.18.1.12 Full Duplex Mode Receiver FIFO Almost Full Level (FIFO\_AFULL\_FDR) — Offset 4830002Ch

Full Duplex Mode Receiver FIFO Almost Full Level.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 4830002Ch	0000001Fh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	1Fh RW	<b>Full Duplex FIFO Almost Full Level (AFULL_THRESHOLD):</b> Determines almost full level in the receive FIFO in full-duplex mode.

#### 14.18.1.13 Time Division Multiplexing Control (TDM\_CTRL) — Offset 48300030h

Time Division Multiplexing Control Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300030h	FFFF0000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	<b>TDM Channel Enable 15 (CH15_EN):</b> TDM interface channel 15 activating bit. When HIGH 15th time slot sample is transmitted and/or received depending on transceiver mode.
30	1h RW	<b>TDM Channel Enable 14 (CH14_EN):</b> TDM interface channel 14 activating bit. When HIGH 14th time slot sample is transmitted and/or received depending on transceiver mode.
29	1h RW	<b>TDM Channel Enable 13 (CH13_EN):</b> TDM interface channel 13 activating bit. When HIGH 13th time slot sample is transmitted and/or received depending on transceiver mode.
28	1h RW	<b>TDM Channel Enable 12 (CH12_EN):</b> TDM interface channel 12 activating bit. When HIGH 12th time slot sample is transmitted and/or received depending on transceiver mode.
27	1h RW	<b>TDM Channel Enable 11 (CH11_EN):</b> TDM interface channel 11 activating bit. When HIGH 11th time slot sample is transmitted and/or received depending on transceiver mode.
26	1h RW	<b>TDM Channel Enable 10 (CH10_EN):</b> TDM interface channel 10 activating bit. When HIGH 10th time slot sample is transmitted and/or received depending on transceiver mode.

Bit Range	Default & Access	Field Name (ID): Description
25	1h RW	<b>TDM Channel Enable 9 (CH9_EN):</b> TDM interface channel 9 activating bit. When HIGH 9th time slot sample is transmitted and/or received depending on transceiver mode.
24	1h RW	<b>TDM Channel Enable 8 (CH8_EN):</b> TDM interface channel 8 activating bit. When HIGH 8th time slot sample is transmitted and/or received depending on transceiver mode.
23	1h RW	<b>TDM Channel Enable 7 (CH7_EN):</b> TDM interface channel 7 activating bit. When HIGH 7th time slot sample is transmitted and/or received depending on transceiver mode.
22	1h RW	<b>TDM Channel Enable 6 (CH6_EN):</b> TDM interface channel 6 activating bit. When HIGH 6th time slot sample is transmitted and/or received depending on transceiver mode.
21	1h RW	<b>TDM Channel Enable 5 (CH5_EN):</b> TDM interface channel 5 activating bit. When HIGH 5th time slot sample is transmitted and/or received depending on transceiver mode.
20	1h RW	<b>TDM Channel Enable 4 (CH4_EN):</b> TDM interface channel 4 activating bit. When HIGH 4th time slot sample is transmitted and/or received depending on transceiver mode.
19	1h RW	<b>TDM Channel Enable 3 (CH3_EN):</b> TDM interface channel 3 activating bit. When HIGH 3rd time slot sample is transmitted and/or received depending on transceiver mode.
18	1h RW	<b>TDM Channel Enable 2 (CH2_EN):</b> TDM interface channel 2 activating bit. When HIGH 2nd time slot sample is transmitted and/or received depending on transceiver mode.
17	1h RW	<b>TDM Channel Enable 1 (CH1_EN):</b> TDM interface channel 1 activating bit. When HIGH 1st time slot sample is transmitted and/or received depending on transceiver mode.
16	1h RW	<b>TDM Channel Enable 0 (CH0_EN):</b> TDM interface channel 0 activating bit. When HIGH zero time slot sample is transmitted and/or received depending on transceiver mode.
15:5	0h RO	<b>Reserved</b>
4:1	0h RW	<b>Tdm Register For Number Of Channels Per Frame (CHN_NO):</b> Number of supported audio channels in TDM compatible interface mode. Written value equals channels number minus 1.
0	0h RW	<b>Time Division Multiplexing Audio Interface Enable (TDM_EN):</b> Time Division Multiplexing audio interface enable. When HIGH audio interface works in TDM compatible mode determined by this register value. When LOW audio interface works in standard stereo I2S mode.

#### 14.18.1.14 Time Division Multiplexing Full Duplex Mode Channels Direction (TDM\_FD\_DIR) — Offset 48300034h

Time Division Multiplexing Full Duplex Mode Channels Direction Register.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300034h	0000FFFFh

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>Full Duplex Rx Channel Enable 15 (CH15_RXEN):</b> TDM interface channel 15 receive enable bit. Active only in full-duplex mode. When HIGH and ch15_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 15 time slot.
30	0h RW	<b>Full Duplex Rx Channel Enable 14 (CH14_RXEN):</b> TDM interface channel 14 receive enable bit. Active only in full-duplex mode. When HIGH and ch14_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 14 time slot.
29	0h RW	<b>Full Duplex Rx Channel Enable 13 (CH13_RXEN):</b> TDM interface channel 13 receive enable bit. Active only in full-duplex mode. When HIGH and ch13_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 13 time slot.
28	0h RW	<b>Full Duplex Rx Channel Enable 12 (CH12_RXEN):</b> TDM interface channel 12 receive enable bit. Active only in full-duplex mode. When HIGH and ch12_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 12 time slot.
27	0h RW	<b>Full Duplex Rx Channel Enable 11 (CH11_RXEN):</b> TDM interface channel 11 receive enable bit. Active only in full-duplex mode. When HIGH and ch11_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 11 time slot.
26	0h RW	<b>Full Duplex Rx Channel Enable 10 (CH10_RXEN):</b> TDM interface channel 10 receive enable bit. Active only in full-duplex mode. When HIGH and ch10_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 10 time slot.
25	0h RW	<b>Full Duplex Rx Channel Enable 9 (CH9_RXEN):</b> TDM interface channel 9 receive enable bit. Active only in full-duplex mode. When HIGH and ch9_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 9 time slot.
24	0h RW	<b>Full Duplex Rx Channel Enable 8 (CH8_RXEN):</b> TDM interface channel 8 receive enable bit. Active only in full-duplex mode. When HIGH and ch8_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 8 time slot.
23	0h RW	<b>Full Duplex Rx Channel Enable 7 (CH7_RXEN):</b> TDM interface channel 7 receive enable bit. Active only in full-duplex mode. When HIGH and ch7_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 7 time slot.
22	0h RW	<b>Full Duplex Rx Channel Enable 6 (CH6_RXEN):</b> TDM interface channel 6 receive enable bit. Active only in full-duplex mode. When HIGH and ch6_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 6 time slot.
21	0h RW	<b>Full Duplex Rx Channel Enable 5 (CH5_RXEN):</b> TDM interface channel 5 receive enable bit. Active only in full-duplex mode. When HIGH and ch5_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 5 time slot.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	<b>Full Duplex Rx Channel Enable 4 (CH4_RXEN):</b> TDM interface channel 4 receive enable bit. Active only in full-duplex mode. When HIGH and ch4_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 4 time slot.
19	0h RW	<b>Full Duplex Rx Channel Enable 3 (CH3_RXEN):</b> TDM interface channel 3 receive enable bit. Active only in full-duplex mode. When HIGH and ch3_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 3 time slot.
18	0h RW	<b>Full Duplex Rx Channel Enable 2 (CH2_RXEN):</b> TDM interface channel 2 receive enable bit. Active only in full-duplex mode. When HIGH and ch2_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 2 time slot.
17	0h RW	<b>Full Duplex Rx Channel Enable 1 (CH1_RXEN):</b> TDM interface channel 1 receive enable bit. Active only in full-duplex mode. When HIGH and ch1_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 1 time slot.
16	0h RW	<b>Full Duplex Tx Channel Enable 0 (CH0_TXEN):</b> TDM interface channel 0 receive enable bit. Active only in full-duplex mode. When HIGH and ch0_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 0 time slot.
15	1h RW	<b>Full Duplex Tx Channel Enable 15 (CH15_TXEN):</b> TDM interface channel 15 transmit enable bit. Active only in full-duplex mode. When HIGH and ch15_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 15 time slot through sdo line.
14	1h RW	<b>Full Duplex Tx Channel Enable 14 (CH14_TXEN):</b> TDM interface channel 14 transmit enable bit. Active only in full-duplex mode. When HIGH and ch14_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 14 time slot through sdo line.
13	1h RW	<b>Full Duplex Tx Channel Enable 13 (CH13_TXEN):</b> TDM interface channel 13 transmit enable bit. Active only in full-duplex mode. When HIGH and ch13_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 13 time slot through sdo line.
12	1h RW	<b>Full Duplex Tx Channel Enable 12 (CH12_TXEN):</b> TDM interface channel 12 transmit enable bit. Active only in full-duplex mode. When HIGH and ch12_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 12 time slot through sdo line.
11	1h RW	<b>Full Duplex Tx Channel Enable 11 (CH11_TXEN):</b> TDM interface channel 11 transmit enable bit. Active only in full-duplex mode. When HIGH and ch11_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 11 time slot through sdo line.
10	1h RW	<b>Full Duplex Tx Channel Enable 10 (CH10_TXEN):</b> TDM interface channel 10 transmit enable bit. Active only in full-duplex mode. When HIGH and ch10_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 10 time slot through sdo line.
9	1h RW	<b>Full Duplex Tx Channel Enable 9 (CH9_TXEN):</b> TDM interface channel 9 transmit enable bit. Active only in full-duplex mode. When HIGH and ch9_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 9 time slot through sdo line.
8	1h RW	<b>Full Duplex Tx Channel Enable 8 (CH8_TXEN):</b> TDM interface channel 8 transmit enable bit. Active only in full-duplex mode. When HIGH and ch8_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 8th time slot through sdo line.
7	1h RW	<b>Full Duplex Tx Channel Enable 7 (CH7_TXEN):</b> TDM interface channel 7 transmit enable bit. Active only in full-duplex mode. When HIGH and ch7_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 7 time slot through sdo line.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RW	<b>Full Duplex Tx Channel Enable 6 (CH6_TXEN):</b> TDM interface channel 6 transmit enable bit. Active only in full-duplex mode. When HIGH and ch6_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 6 time slot through sdo line.
5	1h RW	<b>Full Duplex Tx Channel Enable 5 (CH5_TXEN):</b> TDM interface channel 5 transmit enable bit. Active only in full-duplex mode. When HIGH and ch5_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 5 time slot through sdo line.
4	1h RW	<b>Full Duplex Tx Channel Enable 4 (CH4_TXEN):</b> TDM interface channel 4 transmit enable bit. Active only in full-duplex mode. When HIGH and ch4_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 4 time slot through sdo line.
3	1h RW	<b>Full Duplex Tx Channel Enable 3 (CH3_TXEN):</b> TDM interface channel 3 transmit enable bit. Active only in full-duplex mode. When HIGH and ch3_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 3 time slot through sdo line.
2	1h RW	<b>Full Duplex Tx Channel Enable 2 (CH2_TXEN):</b> TDM interface channel 2 transmit enable bit. Active only in full-duplex mode. When HIGH and ch2_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 2 time slot through sdo line.
1	1h RW	<b>Full Duplex Tx Channel Enable 1 (CH1_TXEN):</b> TDM interface channel 1 transmit enable bit. Active only in full-duplex mode. When HIGH and ch1_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 1 time slot through sdo line.
0	1h RW	<b>Full Duplex Rx Channel Enable 0 (CH0_RXEN):</b> TDM interface channel 0 transmit enable bit. Active only in full-duplex mode. When HIGH and ch0_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 0 time slot through sdo line.

#### 14.18.1.15 TX/RX FIFO (FIFO) — Offset 48300040h

TX/RX FIFO.

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48300040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>SFR:</b> Registers for TX and RX FIFO.

## 14.18.2 I2S\_1 Registers Summary

**Table 14-37. Summary of I2S\_1 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48302000h	4	I2S-SC Control (I2S_CTRL)	000001B8h
48302004h	4	I2S Full Duplex Mode Receiver Control (I2S_CTRL_FDR)	00000010h
48302008h	4	Transceiver Sample Resolution (I2S_SRES)	00000000h
4830200Ch	4	Full Duplex Mode Receive Samples Resolution (I2S_SRES_FDR)	00000000h
48302010h	4	Transceiver Sample Rate (I2S_SRATE)	00000000h
48302014h	4	I2S-SC Status Flags (I2S_STAT)	0003000Ch
48302018h	4	FIFO Using Level(Read Only) (FIFO_LEVEL)	00000000h
4830201Ch	4	FIFO Almost Empty Level (FIFO_AEMPTY)	00000000h
48302020h	4	FIFO Almost Full Level (FIFO_AFULL)	0000001Fh
48302024h	4	Full Duplex Mode Receiver FIFO Using Level(Read Only) (FIFO_LEVEL_FDR)	00000000h
48302028h	4	Full Duplex Mode Receiver FIFO Almost Empty Level (FIFO_AEMPTY_FDR)	00000000h
4830202Ch	4	Full Duplex Mode Receiver FIFO Almost Full Level (FIFO_AFULL_FDR)	0000001Fh
48302030h	4	Time Division Multiplexing Control (TDM_CTRL)	FFFF0000h
48302034h	4	Time Division Multiplexing Full Duplex Mode Channels Direction (TDM_FD_DIR)	0000FFFFh
48302040h	4	TX/RX FIFO (FIFO)	00000000h

### 14.18.2.1 I2S-SC Control (I2S\_CTRL) — Offset 48302000h

I2S-SC Control Register After end of reset bit sfr\_rst triggers to 1 and bit fifo\_RST triggers to 1. Therefore register value after end of reset is 000001B8.

Type	Size	Offset	Default
MMIO	32 bit	48302000h	000001B8h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>Full-Duplex Mode Receiver Samples Resolution (FULL_DUPLEX):</b> Full-duplex mode enable bit. If HIGH transmitter and receiver data units work simultaneously, otherwise only transmitter or receiver is enable in dependent to dir_cfg bit (I2S_CTRL[1]).
30	0h RW	<b>FIFO Almost Full Mask Register (FIFO_AFULL_MASK):</b> Bit masking interrupt request generation after FIFO becomes almost full. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
29	0h RW	<b>FIFO Full Mask Register (FIFO_FULL_MASK):</b> Bit masking interrupt request generation after FIFO becomes full. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
28	0h RW	<b>FIFO Almost Empty Mask Register (FIFO_AEMPTY_MASK):</b> Bit masking interrupt request generation after FIFO becomes almost empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition. Sampled on the rising edge of the clock.
27	0h RW	<b>FIFO Empty Mask Register (FIFO_EMPTY_MASK):</b> Bit masking interrupt request generation after FIFO becomes empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition. Sampled on the rising edge of the clock.
26	0h RW	<b>I2s Mask Register (I2S_MASK):</b> Bit masking interrupt request generation after underrun/overrun condition occurrence in I2S-SC transceiver. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for underrun event interrupt. Sampled on the rising edge of the clock.
25	0h RW	<b>Interrupt Mask Register (INTREQ_MASK):</b> Bit masking all interrupt requests. When LOW all interrupts are masked, when HIGH interrupts use individual masks. Sampled on the rising edge of the clock.
24	0h RW	<b>Transceiver Clock Enable. (I2S_STB):</b> Transceiver clock enable. When LOW the clk_i2s clock is enabled, else clock is disabled. Sampled on the rising edge of the clock.
23	0h RW	<b>Audio Data Sample Alignment At Host Data Bus. (HOST_DATA_ALIGN):</b> Audio data sample alignment at host data bus. When LOW the audio sample data is aligned to the LSB at the host data bus. When HIGH the audio sample data is aligned to the MSB at host data bus. Sampled on the rising edge of the clock.
22	0h RW	<b>Audio Data Sample Arrangement In Audio Data Slot (DATA_ORDER):</b> Bit masking interrupt request generation after FIFO becomes almost empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.
21	0h RW	<b>Audio Sample Alignment In Audio Data Time Slot (DATA_ALIGN):</b> Bit masking interrupt request generation after FIFO becomes empty. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for transmitter FIFO empty condition.

Bit Range	Default & Access	Field Name (ID): Description
20:16	00h RW	<b>Audio Data Delay After WS Signal (DATA_WS_DEL):</b> Bit masking interrupt request generation after underrun/overrun condition occurrence in I2S-SC transceiver. When LOW, masks generation of interrupt request. When full-duplex mode is active, this bit is a mask only for underrun event interrupt.
15	0h RW	<b>The Word Select Signal Polarity Selection. (WS_POLAR):</b> Bit masking all interrupt requests. When LOW all interrupts are masked, when HIGH interrupts use individual masks.
14	0h RW	<b>The Continuous Serial Clock Active Edge. (SCK_POLAR):</b> Transceiver clock enable. When LOW the clk_i2s clock is enabled, else clock is disabled.
13	0h RW	<b>Mono/Stereo Audio Mode Selection (AUDIO_MODE):</b> Audio data sample alignment at host data bus. When LOW the audio sample data is aligned to the LSB at the host data bus. When HIGH the audio sample data is aligned to the MSB at host data bus.
12	0h RW	<b>Active Audio Channel In Mono Mode (MONO_MODE):</b> Active audio channel in mono mode. When LOW left audio channel is active. When HIGH right audio channel is active.
11:8	1h RW	<b>Word Select Signal (WS) Format. (WS_MODE):</b> Word select signal (WS) format. TDM mode is not active: Only bit 8 is relevant. If it is set to LOW (even value of ws_mode) WS signal have DSP audio interface specification format. If it is set to HIGH (odd value of ws_mode) WS signal have standard I2S audio interface specification format. TDM mode is active: When field equals 0 WS signal has DSP audio interface specification format, otherwise (ws_mode field equals the value from range 1 & CHN_NO-1) WS.
7:5	5h RW	<b>Audio Channel Time Slot Width (CHN_WIDTH):</b> Audio channel time slot width in I2S master or DSP/TDM master and slave modes. 0 8 SCK cycles per audio channel 1 12 SCK cycles per audio channel 2 16 SCK cycles per audio channel 3 18 SCK cycles per audio channel 4 20 SCK cycles per audio channel 5 24 SCK cycles per audio channel 6 28 SCK cycles per audio channel 7 32 SCK cycles per audio channel.
4	1h RW	<b>FIFO Reset (FIFO_RST):</b> FIFO reset. When LOW, FIFO pointer is reset to zero. Threshold levels for FIFO are unchanged. This bit is automatically set to HIGH after one clock cycle. In full-duplex mode this bit resets only transmitter FIFO.
3	1h RW	<b>SFR Block Synchronous Reset (SFR_RST):</b> SFR block synchronous reset. When LOW, all bits in SFR registers are reset to default values. This bit is automatically set to HIGH after one clock cycle.
2	0h RW	<b>Configuration Bit For Transceiver Synchronizing Unit (MS_CFG):</b> Configuration bit for transceiver synchronizing unit: 1 Master 0 Slave.
1	0h RW	<b>Direction Of Transmission (DIR_CFG):</b> 1 Transmitter 0 Receiver.
0	0h RW	<b>Enable Bit For I2S Transceiver (I2S_EN):</b> 1 enables transceiver 0 disables transceiver, causes synchronous reset signal, configuration SFR bits are unchanged .

#### 14.18.2.2 I2S Full Duplex Mode Receiver Control (I2S\_CTRL\_FDR) — Offset 48302004h

I2S Full Duplex Mode Receiver Control Register After end of reset bit FIFO\_rst triggers to 1. Therefore register value after end of reset is 00000010.

Type	Size	Offset	Default
MMIO	32 bit	48302004h	00000010h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved</b>
30	0h RW	<b>Full Duplex Almost FIFO Full Mask Register (RFIFO_AFULL_MASK):</b> Bit masking interrupt request generation after full-duplex mode receive FIFO becomes almost full. When LOW, masks generation of interrupt request.
29	0h RW	<b>Full Duplex FIFO Full Mask Register (RFIFO_FULL_MASK):</b> Bit masking interrupt request generation after full-duplex mode receive FIFO becomes full. When LOW, masks generation of interrupt request.
28	0h RW	<b>Full Duplex Almost FIFO Empty Mask Register (RFIFO_AEMPTY_MASK):</b> Bit masking interrupt request generation after full-duplex mode receive FIFO becomes almost empty. When LOW, masks generation of interrupt request.
27	0h RW	<b>Full Duplex FIFO Empty Mask Register (RFIFO_EMPTY_MASK):</b> Bit masking interrupt request generation after full-duplex mode receive FIFO becomes empty. When LOW, masks generation of interrupt request.
26	0h RW	<b>Full Duplex I2s_mask Register (RI2S_MASK):</b> Bit masking interrupt request generation after overrun condition occurrence in I2S-SC full-duplex mode receiver. When LOW, masks generation of interrupt request.
25:5	0h RO	<b>Reserved</b>
4	1h RW	<b>Full-Duplex Mode Receiver FIFO Reset. (FIFO_RST):</b> Full-duplex mode receiver FIFO reset. Active only in full-duplex mode. When '0', RFIFO pointer is reset to zero. Threshold levels for RFIFO are unchanged. The bit is automatically set to '1' after one clock cycle.
3:0	0h RO	<b>Reserved</b>

#### 14.18.2.3 Transceiver Sample Resolution (I2S\_SRES) — Offset 48302008h

Transceiver Sample Resolution.

Type	Size	Offset	Default
MMIO	32 bit	48302008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	00h RW	<b>Samples Resolution. (RESOLUTION):</b> Samples resolution. When full-duplex mode is active, this value specifies resolution only for transmitted samples. Sampled on the rising edge of the clock. It simply should be assigned the value equal to the number of valid bits minus one, for example: 00000B sample resolution = 1 bit 11111B sample resolution = 32 bits.

#### 14.18.2.4 Full Duplex Mode Receive Samples Resolution (I2S\_SRES\_FDR) — Offset 4830200Ch

Full Duplex Mode Receive Samples Resolution.

Type	Size	Offset	Default
MMIO	32 bit	4830200Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	00h RW	<b>I2s_sres Register - Samples Resolution (RESOLUTION):</b> Full-duplex mode receive samples resolution. When half-duplex mode is active this value is ignored. It simply should be assigned the value equal to the number of valid bits minus one, for example: 00000B sample resolution = 1 bit 11111B sample resolution = 32 bits.

#### 14.18.2.5 Transceiver Sample Rate (I2S\_SRATE) — Offset 48302010h

Transceiver Sample Rate.

Type	Size	Offset	Default
MMIO	32 bit	48302010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19:0	00000h RW	<b>SAMPLE_RATE:</b> In general value of sample rate is the quotient of clk frequency and I2S rate [bit/s]. The value of sample rate is the higher the clk frequency is greater than I2S rate.

#### 14.18.2.6 I2S-SC Status Flags (I2S\_STAT) — Offset 48302014h

I2S-SC Status Flags Register.

Type	Size	Offset	Default
MMIO	32 bit	48302014h	0003000Ch

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19	0h RW	<b>Receive FIFO Almost Full Flag In Full-Duplex Mode (RFIFO_AFULL):</b> Receive FIFO almost full flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO becomes almost full (rising edge of almost full condition).
18	0h RW	<b>Receive FIFO Full Flag In Full-Duplex Mode (RFIFO_FULL):</b> Receive FIFO full flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO is full.
17	1h RW	<b>Receive FIFO Almost Empty Flag In Full-Duplex Mode (RFIFO_AEMPTY):</b> Receive FIFO almost empty flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO becomes almost empty (rising edge of almost empty condition).
16	1h RW	<b>Receive FIFO Empty Flag In Full-Duplex Mode (RFIFO_EMPTY):</b> Receive FIFO empty flag in full-duplex mode. Active HIGH. This flag is set to HIGH when RX FIFO is empty.
15:6	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	<b>FIFO Almost Full Flag (FIFO_AFULL):</b> FIFO almost full flag. Active HIGH. This flag is set to HIGH when FIFO becomes almost full (rising edge of almost full condition). When full-duplex mode is active, this bit is a flag only for transmitter FIFO almost full condition.
4	0h RW	<b>FIFO Full Flag (FIFO_FULL):</b> FIFO full flag. Active HIGH. This flag is set to HIGH when FIFO is full. When full-duplex mode is active, this bit is a flag only for transmitter FIFO full condition.
3	1h RW	<b>FIFO Almost Empty Flag (FIFO_AEMPTY):</b> FIFO almost empty flag. Active HIGH. This flag is set to HIGH when FIFO becomes almost empty (rising edge of almost empty condition). When full-duplex mode is active, this bit is a flag only for transmitter FIFO almost empty condition.
2	1h RW	<b>FIFO Empty Flag (FIFO_EMPTY):</b> FIFO empty flag. Active HIGH. This flag is set to HIGH when FIFO is empty. When full-duplex mode is active, this bit is a flag only for transmitter FIFO empty condition.
1	0h RW	<b>RDATA_OVRERR:</b> Indicates data overrun error for transceiver in receiver mode, active HIGH. Sampled and updated on the rising edge of the clock. Writing LOW value to this bit resets the transceiver and the FIFO. The transceiver configuration is preserved.
0	0h RW	<b>Full Duplex Mode Samples Resolution Register (TDATA_UNDERR):</b> Indicates data underrun event, active HIGH. This flag is set to HIGH when TX underrun arises (rising edge of underrun condition).

#### 14.18.2.7 FIFO Using Level(Read Only) (FIFO\_LEVEL) — Offset 48302018h

FIFO Using Level Register (read only).

Type	Size	Offset	Default
MMIO	32 bit	48302018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RO	<b>FIFO Level Register (FIFO_LEVEL):</b> Indicates FIFO level. Updated on the rising edge of the clock. When full-duplex mode is active, this register holds value of the transmitter FIFO level. When half-duplex mode is active, this register holds value of the transmitter or receiver FIFO level independent to the transmit/receive direction mode.

#### 14.18.2.8 FIFO Almost Empty Level (FIFO\_AEMPTY) — Offset 4830201Ch

FIFO Almost Empty Level.

Type	Size	Offset	Default
MMIO	32 bit	4830201Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	00h RW	<b>FIFO Almost Empty Threshold Level (AEMPTY_THRESHOLD):</b> Determines threshold for almost empty flag in the FIFO. When full-duplex mode is active, this register specifies an almost empty level of the transmitter FIFO level.

#### 14.18.2.9 FIFO Almost Full Level (FIFO\_AFULL) — Offset 48302020h

FIFO Almost Full Level.

Type	Size	Offset	Default
MMIO	32 bit	48302020h	0000001Fh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	1Fh RW	<b>FIFO Aempty Threshold Level (AFULL_THRESHOLD):</b> Determines threshold for almost full flag in the FIFO. When full-duplex mode is active, this register specifies an almost full level of the transmitter FIFO level.

#### 14.18.2.10 Full Duplex Mode Receiver FIFO Using Level(Read Only) (FIFO\_LEVEL\_FDR) — Offset 48302024h

Full Duplex Mode Receiver FIFO Using Level Register (read only).

Type	Size	Offset	Default
MMIO	32 bit	48302024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5:0	00h RO	<b>Full Duplex FIFO Level (RX_FIFO_LEVEL):</b> Full-duplex mode receive FIFO level.

#### 14.18.2.11 Full Duplex Mode Receiver FIFO Almost Empty Level (FIFO\_AEMPTY\_FDR) — Offset 48302028h

Full Duplex Mode Receiver FIFO Almost Empty Level.

Type	Size	Offset	Default
MMIO	32 bit	48302028h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	00h RW	<b>Full Duplex FIFO Almost Empty Level (AEMPTY_THRESHOLD):</b> Determines almost empty level in the receive FIFO in full-duplex mode.

#### 14.18.2.12 Full Duplex Mode Receiver FIFO Almost Full Level (FIFO\_AFULL\_FDR) — Offset 4830202Ch

Full Duplex Mode Receiver FIFO Almost Full Level.

Type	Size	Offset	Default
MMIO	32 bit	4830202Ch	0000001Fh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4:0	1Fh RW	<b>Full Duplex FIFO Almost Full Level (AFULL_THRESHOLD):</b> Determines almost full level in the receive FIFO in full-duplex mode.

#### 14.18.2.13 Time Division Multiplexing Control (TDM\_CTRL) — Offset 48302030h

Time Division Multiplexing Control Register.

Type	Size	Offset	Default
MMIO	32 bit	48302030h	FFFF0000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	<b>TDM Channel Enable 15 (CH15_EN):</b> TDM interface channel 15 activating bit. When HIGH 15th time slot sample is transmitted and/or received depending on transceiver mode.
30	1h RW	<b>TDM Channel Enable 14 (CH14_EN):</b> TDM interface channel 14 activating bit. When HIGH 14th time slot sample is transmitted and/or received depending on transceiver mode.
29	1h RW	<b>TDM Channel Enable 13 (CH13_EN):</b> TDM interface channel 13 activating bit. When HIGH 13th time slot sample is transmitted and/or received depending on transceiver mode.
28	1h RW	<b>TDM Channel Enable 12 (CH12_EN):</b> TDM interface channel 12 activating bit. When HIGH 12th time slot sample is transmitted and/or received depending on transceiver mode.
27	1h RW	<b>TDM Channel Enable 11 (CH11_EN):</b> TDM interface channel 11 activating bit. When HIGH 11th time slot sample is transmitted and/or received depending on transceiver mode.
26	1h RW	<b>TDM Channel Enable 10 (CH10_EN):</b> TDM interface channel 10 activating bit. When HIGH 10th time slot sample is transmitted and/or received depending on transceiver mode.

Bit Range	Default & Access	Field Name (ID): Description
25	1h RW	<b>TDM Channel Enable 9 (CH9_EN):</b> TDM interface channel 9 activating bit. When HIGH 9th time slot sample is transmitted and/or received depending on transceiver mode.
24	1h RW	<b>TDM Channel Enable 8 (CH8_EN):</b> TDM interface channel 8 activating bit. When HIGH 8th time slot sample is transmitted and/or received depending on transceiver mode.
23	1h RW	<b>TDM Channel Enable 7 (CH7_EN):</b> TDM interface channel 7 activating bit. When HIGH 7th time slot sample is transmitted and/or received depending on transceiver mode.
22	1h RW	<b>TDM Channel Enable 6 (CH6_EN):</b> TDM interface channel 6 activating bit. When HIGH 6th time slot sample is transmitted and/or received depending on transceiver mode.
21	1h RW	<b>TDM Channel Enable 5 (CH5_EN):</b> TDM interface channel 5 activating bit. When HIGH 5th time slot sample is transmitted and/or received depending on transceiver mode.
20	1h RW	<b>TDM Channel Enable 4 (CH4_EN):</b> TDM interface channel 4 activating bit. When HIGH 4th time slot sample is transmitted and/or received depending on transceiver mode.
19	1h RW	<b>TDM Channel Enable 3 (CH3_EN):</b> TDM interface channel 3 activating bit. When HIGH 3rd time slot sample is transmitted and/or received depending on transceiver mode.
18	1h RW	<b>TDM Channel Enable 2 (CH2_EN):</b> TDM interface channel 2 activating bit. When HIGH 2nd time slot sample is transmitted and/or received depending on transceiver mode.
17	1h RW	<b>TDM Channel Enable 1 (CH1_EN):</b> TDM interface channel 1 activating bit. When HIGH 1st time slot sample is transmitted and/or received depending on transceiver mode.
16	1h RW	<b>TDM Channel Enable 0 (CH0_EN):</b> TDM interface channel 0 activating bit. When HIGH zero time slot sample is transmitted and/or received depending on transceiver mode.
15:5	0h RO	<b>Reserved</b>
4:1	0h RW	<b>Tdm Register For Number Of Channels Per Frame (CHN_NO):</b> Number of supported audio channels in TDM compatible interface mode. Written value equals channels number minus 1.
0	0h RW	<b>Time Division Multiplexing Audio Interface Enable (TDM_EN):</b> Time Division Multiplexing audio interface enable. When HIGH audio interface works in TDM compatible mode determined by this register value. When LOW audio interface works in standard stereo I2S mode.

#### 14.18.2.14 Time Division Multiplexing Full Duplex Mode Channels Direction (TDM\_FD\_DIR) — Offset 48302034h

Time Division Multiplexing Full Duplex Mode Channels Direction Register.

Type	Size	Offset	Default
MMIO	32 bit	48302034h	0000FFFFh

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>Full Duplex Rx Channel Enable 15 (CH15_RXEN):</b> TDM interface channel 15 receive enable bit. Active only in full-duplex mode. When HIGH and ch15_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 15 time slot.
30	0h RW	<b>Full Duplex Rx Channel Enable 14 (CH14_RXEN):</b> TDM interface channel 14 receive enable bit. Active only in full-duplex mode. When HIGH and ch14_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 14 time slot.
29	0h RW	<b>Full Duplex Rx Channel Enable 13 (CH13_RXEN):</b> TDM interface channel 13 receive enable bit. Active only in full-duplex mode. When HIGH and ch13_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 13 time slot.
28	0h RW	<b>Full Duplex Rx Channel Enable 12 (CH12_RXEN):</b> TDM interface channel 12 receive enable bit. Active only in full-duplex mode. When HIGH and ch12_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 12 time slot.
27	0h RW	<b>Full Duplex Rx Channel Enable 11 (CH11_RXEN):</b> TDM interface channel 11 receive enable bit. Active only in full-duplex mode. When HIGH and ch11_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 11 time slot.
26	0h RW	<b>Full Duplex Rx Channel Enable 10 (CH10_RXEN):</b> TDM interface channel 10 receive enable bit. Active only in full-duplex mode. When HIGH and ch10_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 10 time slot.
25	0h RW	<b>Full Duplex Rx Channel Enable 9 (CH9_RXEN):</b> TDM interface channel 9 receive enable bit. Active only in full-duplex mode. When HIGH and ch9_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 9 time slot.
24	0h RW	<b>Full Duplex Rx Channel Enable 8 (CH8_RXEN):</b> TDM interface channel 8 receive enable bit. Active only in full-duplex mode. When HIGH and ch8_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 8 time slot.
23	0h RW	<b>Full Duplex Rx Channel Enable 7 (CH7_RXEN):</b> TDM interface channel 7 receive enable bit. Active only in full-duplex mode. When HIGH and ch7_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 7 time slot.
22	0h RW	<b>Full Duplex Rx Channel Enable 6 (CH6_RXEN):</b> TDM interface channel 6 receive enable bit. Active only in full-duplex mode. When HIGH and ch6_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 6 time slot.
21	0h RW	<b>Full Duplex Rx Channel Enable 5 (CH5_RXEN):</b> TDM interface channel 5 receive enable bit. Active only in full-duplex mode. When HIGH and ch5_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 5 time slot.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	<b>Full Duplex Rx Channel Enable 4 (CH4_RXEN):</b> TDM interface channel 4 receive enable bit. Active only in full-duplex mode. When HIGH and ch4_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 4 time slot.
19	0h RW	<b>Full Duplex Rx Channel Enable 3 (CH3_RXEN):</b> TDM interface channel 3 receive enable bit. Active only in full-duplex mode. When HIGH and ch3_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 3 time slot.
18	0h RW	<b>Full Duplex Rx Channel Enable 2 (CH2_RXEN):</b> TDM interface channel 2 receive enable bit. Active only in full-duplex mode. When HIGH and ch2_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 2 time slot.
17	0h RW	<b>Full Duplex Rx Channel Enable 1 (CH1_RXEN):</b> TDM interface channel 1 receive enable bit. Active only in full-duplex mode. When HIGH and ch1_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 1 time slot.
16	0h RW	<b>Full Duplex Tx Channel Enable 0 (CH0_TXEN):</b> TDM interface channel 0 receive enable bit. Active only in full-duplex mode. When HIGH and ch0_en bit in TDM_CTRL register is HIGH audio sample is received from sdi line at 0 time slot.
15	1h RW	<b>Full Duplex Tx Channel Enable 15 (CH15_TXEN):</b> TDM interface channel 15 transmit enable bit. Active only in full-duplex mode. When HIGH and ch15_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 15 time slot through sdo line.
14	1h RW	<b>Full Duplex Tx Channel Enable 14 (CH14_TXEN):</b> TDM interface channel 14 transmit enable bit. Active only in full-duplex mode. When HIGH and ch14_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 14 time slot through sdo line.
13	1h RW	<b>Full Duplex Tx Channel Enable 13 (CH13_TXEN):</b> TDM interface channel 13 transmit enable bit. Active only in full-duplex mode. When HIGH and ch13_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 13 time slot through sdo line.
12	1h RW	<b>Full Duplex Tx Channel Enable 12 (CH12_TXEN):</b> TDM interface channel 12 transmit enable bit. Active only in full-duplex mode. When HIGH and ch12_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 12 time slot through sdo line.
11	1h RW	<b>Full Duplex Tx Channel Enable 11 (CH11_TXEN):</b> TDM interface channel 11 transmit enable bit. Active only in full-duplex mode. When HIGH and ch11_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 11 time slot through sdo line.
10	1h RW	<b>Full Duplex Tx Channel Enable 10 (CH10_TXEN):</b> TDM interface channel 10 transmit enable bit. Active only in full-duplex mode. When HIGH and ch10_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 10 time slot through sdo line.
9	1h RW	<b>Full Duplex Tx Channel Enable 9 (CH9_TXEN):</b> TDM interface channel 9 transmit enable bit. Active only in full-duplex mode. When HIGH and ch9_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 9 time slot through sdo line.
8	1h RW	<b>Full Duplex Tx Channel Enable 8 (CH8_TXEN):</b> TDM interface channel 8 transmit enable bit. Active only in full-duplex mode. When HIGH and ch8_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 8th time slot through sdo line.
7	1h RW	<b>Full Duplex Tx Channel Enable 7 (CH7_TXEN):</b> TDM interface channel 7 transmit enable bit. Active only in full-duplex mode. When HIGH and ch7_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 7 time slot through sdo line.

Bit Range	Default & Access	Field Name (ID): Description
6	1h RW	<b>Full Duplex Tx Channel Enable 6 (CH6_TXEN):</b> TDM interface channel 6 transmit enable bit. Active only in full-duplex mode. When HIGH and ch6_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 6 time slot through sdo line.
5	1h RW	<b>Full Duplex Tx Channel Enable 5 (CH5_TXEN):</b> TDM interface channel 5 transmit enable bit. Active only in full-duplex mode. When HIGH and ch5_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 5 time slot through sdo line.
4	1h RW	<b>Full Duplex Tx Channel Enable 4 (CH4_TXEN):</b> TDM interface channel 4 transmit enable bit. Active only in full-duplex mode. When HIGH and ch4_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 4 time slot through sdo line.
3	1h RW	<b>Full Duplex Tx Channel Enable 3 (CH3_TXEN):</b> TDM interface channel 3 transmit enable bit. Active only in full-duplex mode. When HIGH and ch3_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 3 time slot through sdo line.
2	1h RW	<b>Full Duplex Tx Channel Enable 2 (CH2_TXEN):</b> TDM interface channel 2 transmit enable bit. Active only in full-duplex mode. When HIGH and ch2_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 2 time slot through sdo line.
1	1h RW	<b>Full Duplex Tx Channel Enable 1 (CH1_TXEN):</b> TDM interface channel 1 transmit enable bit. Active only in full-duplex mode. When HIGH and ch1_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 1 time slot through sdo line.
0	1h RW	<b>Full Duplex Rx Channel Enable 0 (CH0_RXEN):</b> TDM interface channel 0 transmit enable bit. Active only in full-duplex mode. When HIGH and ch0_en bit in TDM_CTRL register is HIGH audio sample is transmitted at 0 time slot through sdo line.

#### 14.18.2.15 TX/RX FIFO (FIFO) — Offset 48302040h

TX/RX FIFO.

Type	Size	Offset	Default
MMIO	32 bit	48302040h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>SFR:</b> Registers for TX and RX FIFO.

## 14.19 Timers Registers

Timers Registers	Address Offset	Table
Timers	48400000h - 484000CCh	Table 13-38

### 14.19.1 Timers Registers Summary

**Table 14-38. Summary of Timers Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48400000h	4	TIMER1LOADCOUNT	00000000h
48400004h	4	TIMER1CURRENTVAL	80000000h
48400008h	4	TIMER1CONTROLREG	00000000h
4840000Ch	4	TIMER1EOI	00000000h
48400010h	4	TIMER1INTSTAT	00000000h
48400014h	4	TIMER2LOADCOUNT	00000000h
48400018h	4	TIMER2CURRENTVAL	80000000h
4840001Ch	4	TIMER2CONTROLREG	00000000h
48400020h	4	TIMER2EOI	00000000h
48400024h	4	TIMER2INTSTAT	00000000h
48400028h	4	TIMER3LOADCOUNT	00000000h
4840002Ch	4	TIMER3CURRENTVAL	80000000h
48400030h	4	TIMER3CONTROLREG	00000000h
48400034h	4	TIMER3EOI	00000000h
48400038h	4	TIMER3INTSTAT	00000000h
4840003Ch	4	TIMER4LOADCOUNT	00000000h
48400040h	4	TIMER4CURRENTVAL	80000000h
48400044h	4	TIMER4CONTROLREG	00000000h
48400048h	4	TIMER4EOI	00000000h
4840004Ch	4	TIMER4INTSTAT	00000000h
48400050h	4	TIMER5LOADCOUNT	00000000h
48400054h	4	TIMER5CURRENTVAL	80000000h
48400058h	4	TIMER5CONTROLREG	00000000h
4840005Ch	4	TIMER5EOI	00000000h
48400060h	4	TIMER5INTSTAT	00000000h
48400064h	4	TIMER6LOADCOUNT	00000000h
48400068h	4	TIMER6CURRENTVAL	80000000h
4840006Ch	4	TIMER6CONTROLREG	00000000h
48400070h	4	TIMER6EOI	00000000h
48400074h	4	TIMER6INTSTAT	00000000h
48400078h	4	TIMER7LOADCOUNT	00000000h
4840007Ch	4	TIMER7CURRENTVAL	80000000h
48400080h	4	TIMER7CONTROLREG	00000000h
48400084h	4	TIMER7EOI	00000000h
48400088h	4	TIMER7INTSTAT	00000000h
4840008Ch	4	TIMER8LOADCOUNT	00000000h
48400090h	4	TIMER8CURRENTVAL	80000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48400094h	4	TIMER8CONTROLREG	00000000h
48400098h	4	TIMER8EOI	00000000h
4840009Ch	4	TIMER8INTSTAT	00000000h
484000A0h	4	TIMERSINTSTAT	00000000h
484000A4h	4	TIMERSEOI	00000000h
484000A8h	4	TIMERSRAWINTSTAT	00000000h
484000ACh	4	TIMERSCOMPVERSION	3231302Ah
484000B0h	4	TIMER1LOADCOUNT2	00000000h
484000B4h	4	TIMER2LOADCOUNT2	00000000h
484000B8h	4	TIMER3LOADCOUNT2	00000000h
484000BCh	4	TIMER4LOADCOUNT2	00000000h
484000C0h	4	TIMER5LOADCOUNT2	00000000h
484000C4h	4	TIMER6LOADCOUNT2	00000000h
484000C8h	4	TIMER7LOADCOUNT2	00000000h
484000CCh	4	TIMER8LOADCOUNT2	00000000h

#### 14.19.1.1 TIMER1LOADCOUNT — Offset 48400000h

Timer1 Load Count Register - Name: Timer1 Load Count Register Size: 8-32 bits Address Offset: 0x00 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	48400000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER1LOADCOUNT:</b> Value to be loaded into Timer1. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

#### 14.19.1.2 TIMER1CURRENTVAL — Offset 48400004h

Name: Timer1 Current Value Size: 8-32 bits Address Offset: 4 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400004h	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	<b>TIMER1CURRENTVAL:</b> Current Value of Timer1. This register is supported only when timer_1_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

#### 14.19.1.3 TIMER1CONTROLREG — Offset 48400008h

Timer1 Control Register - Name: Timer1 Control Register Size: 4 bits Address Offset: 8 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer1. You can program each Timer1ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	48400008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>TIMER_PWM:</b> Pulse Width Modulation of timer_1_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	<b>TIMER_INTERRUPT_MASK:</b> Timer interrupt mask for Timer1. 0: not masked 1: masked
1	0h RW	<b>TIMER_MODE:</b> Timer mode for Timer1. 0: free_running mode 1: user_defined count mode NOTE: You must set the Timer1LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	<b>TIMER_ENABLE:</b> Timer enable bit for Timer1. 0: disable 1: enable

#### 14.19.1.4 TIMER1EOI — Offset 4840000Ch

Timer1 End-of-Interrupt Register - Name: Timer1 End-of-Interrupt Register Size: 1 bit  
Address Offset: 12 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	4840000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER1EOI:</b> Reading from this register returns all zeroes (0) and clears the interrupt from Timer1.

#### 14.19.1.5 TIMER1INTSTAT — Offset 48400010h

Timer1 Interrupt Status Register - Name: Timer1 Interrupt Status Register Size: 1 bit  
Address Offset: 16 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER1INTSTAT:</b> Contains the interrupt status for Timer1.

#### 14.19.1.6 TIMER2LOADCOUNT — Offset 48400014h

Timer2 Load Count Register - Name: Timer2 Load Count Register Size: 8-32 bits  
Address Offset: 20 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	48400014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER2LOADCOUNT:</b> Value to be loaded into Timer2. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

#### 14.19.1.7 TIMER2CURRENTVAL — Offset 48400018h

Timer2 Current Value - Name: Timer2 Current Value Size: 8-32 bits Address Offset: 24  
Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400018h	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	<b>TIMER2CURRENTVAL:</b> Current Value of Timer2. This register is supported only when timer_2_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

#### 14.19.1.8 TIMER2CONTROLREG — Offset 4840001Ch

Timer2 Control Register - Name: Timer2 Control Register Size: 3 bits Address Offset: 28  
Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer2. You can program each Timer2ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	4840001Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>TIMER_PWM:</b> Pulse Width Modulation of timer_2_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	<b>TIMER_INTERRUPT_MASK:</b> Timer interrupt mask for Timer2. 0: not masked 1: masked
1	0h RW	<b>TIMER_MODE:</b> Timer mode for Timer2. 0: free-running mode 1: user-defined count mode NOTE: You must set the Timer2LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	<b>TIMER_ENABLE:</b> Timer enable bit for Timer2. 0: disable 1: enable

#### 14.19.1.9 TIMER2EOI — Offset 48400020h

Timer2 End-of-Interrupt Register - Name: Timer2 End-of-Interrupt Register Size: 1 bit Address Offset: 32 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER2EOI:</b> Reading from this register returns all zeroes (0) and clears the interrupt from Timer2.

#### 14.19.1.10 TIMER2INTSTAT — Offset 48400024h

Timer2 Interrupt Status Register - Name: Timer2 Interrupt Status Register Size: 1 bit Address Offset: 36 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER2INTSTAT:</b> Contains the interrupt status for Timer2.

#### 14.19.1.11 TIMER3LOADCOUNT — Offset 48400028h

Timer1 Load Count Register - Name: Timer3 Load Count Register Size: 8-32 bits Address Offset: 40 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	48400028h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER3LOADCOUNT:</b> Value to be loaded into Timer3. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

#### 14.19.1.12 TIMER3CURRENTVAL — Offset 4840002Ch

Timer3 Current Value - Name: Timer3 Current Value Size: 8-32 bits Address Offset: 44 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	4840002Ch	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	<b>TIMER3CURRENTVAL:</b> Current Value of Timer3. This register is supported only when timer_3_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

#### 14.19.1.13 TIMER3CONTROLREG — Offset 48400030h

Timer3 Control Register - Name: Timer3 Control Register Size: 4 bits Address Offset: 48 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer3. You can program each Timer3ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	48400030h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>TIMER_PWM:</b> Pulse Width Modulation of timer_3_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	<b>TIMER_INTERRUPT_MASK:</b> Timer interrupt mask for Timer3. 0: not masked 1: masked
1	0h RW	<b>TIMER_MODE:</b> Timer mode for Timer3. 0: free-running mode 1: user-defined count mode NOTE: You must set the Timer3LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	<b>TIMER_ENABLE:</b> Timer enable bit for Timer3. 0: disable 1: enable

#### 14.19.1.14 TIMER3EOI — Offset 48400034h

Timer3 End-of-Interrupt Register - Name: Timer3 End-of-Interrupt Register Size: 1 bit  
Address Offset: 52 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400034h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER3EOI:</b> Reading from this register returns all zeroes (0) and clears the interrupt from Timer3.

#### 14.19.1.15 TIMER3INTSTAT — Offset 48400038h

Timer3 Interrupt Status Register - Name: Timer3 Interrupt Status Register Size: 1 bit  
Address Offset: 56 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400038h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER3INTSTAT:</b> Contains the interrupt status for Timer3.

#### 14.19.1.16 TIMER4LOADCOUNT — Offset 4840003Ch

Timer4 Load Count Register - Name: Timer4 Load Count Register Size: 8-32 bits  
Address Offset: 60 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	4840003Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER4LOADCOUNT:</b> Value to be loaded into Timer4. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

#### 14.19.1.17 TIMER4CURRENTVAL — Offset 48400040h

Timer4 Current Value Register - Name: Timer4 Current Value Size: 8-32 bits Address Offset: 64 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400040h	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	<b>TIMER4CURRENTVAL:</b> Current Value of Timer4. This register is supported only when timer_4_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

#### 14.19.1.18 TIMER4CONTROLREG — Offset 48400044h

Timer4 Control Register - Name: Timer4 Control Register Size: 4 bits Address Offset: 68 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer4. You can program each Timer4ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	48400044h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>TIMER_PWM:</b> Pulse Width Modulation of timer_4_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	<b>TIMER_INTERRUPT_MASK:</b> Timer interrupt mask for Timer4. 0: not masked 1: masked
1	0h RW	<b>TIMER_MODE:</b> Timer mode for Timer4. 0: free-running mode 1: user-defined count mode NOTE: You must set the Timer4LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	<b>TIMER_ENABLE:</b> Timer enable bit for Timer4. 0: disable 1: enable

#### 14.19.1.19 TIMER4EOI — Offset 48400048h

Timer4 End-of-Interrupt Register - Name: Timer4 End-of-Interrupt Register Size: 1 bit  
Address Offset: 72 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400048h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER4EOI:</b> Reading from this register returns all zeroes (0) and clears the interrupt from Timer4.

#### 14.19.1.20 TIMER4INTSTAT — Offset 4840004Ch

Timer4 Interrupt Status Register - Name: Timer4 Interrupt Status Register Size: 1 bit  
Address Offset: 76 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	4840004Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER4INTSTAT:</b> Contains the interrupt status for Timer4.

#### 14.19.1.21 TIMER5LOADCOUNT — Offset 48400050h

Timer5 Load Count Register - Name: Timer5 Load Count Register Size: 8-32 bits Address Offset: 80 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	48400050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER5LOADCOUNT:</b> Value to be loaded into Timer5. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

#### 14.19.1.22 TIMER5CURRENTVAL — Offset 48400054h

Timer5 Current Value - Name: Timer5 Current Value Size: 8-32 bits Address Offset: 84 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400054h	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	<b>TIMER5CURRENTVAL:</b> Current Value of Timer5. This register is supported only when timer_5_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

#### 14.19.1.23 TIMER5CONTROLREG — Offset 48400058h

Timer5 Control Register - Name: Timer5 Control Register Size: 4 bits Address Offset: 88 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer5. You can program each Timer5ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	48400058h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>TIMER_PWM:</b> Pulse Width Modulation of timer_5_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	<b>TIMER_INTERRUPT_MASK:</b> Timer interrupt mask for Timer5. 0: not masked 1: masked
1	0h RW	<b>TIMER_MODE:</b> Timer mode for Timer5. 0: free-running mode 1: user-defined count mode NOTE: You must set the Timer5LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	<b>TIMER_ENABLE:</b> Timer enable bit for Timer5. 0: disable 1: enable

#### 14.19.1.24 TIMER5EOI — Offset 4840005Ch

Timer5 End-of-Interrupt Register - Name: Timer5 End-of-Interrupt Register Size: 1 bit  
Address Offset: 92 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	4840005Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER5EOI:</b> Reading from this register returns all zeroes (0) and clears the interrupt from Timer5.

#### 14.19.1.25 TIMER5INTSTAT — Offset 48400060h

Timer5 Interrupt Status Register - Name: Timer5 Interrupt Status Register Size: 1 bit  
Address Offset: 96 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400060h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER5INTSTAT:</b> Contains the interrupt status for Timer5.

#### 14.19.1.26 TIMER6LOADCOUNT — Offset 48400064h

Timer6 Load Count Register - Name: Timer6 Load Count Register Size: 8-32 bits  
Address Offset: 100 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	48400064h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER6LOADCOUNT:</b> Value to be loaded into Timer6. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

#### 14.19.1.27 TIMER6CURRENTVAL — Offset 48400068h

Timer6 Current Value Register - Name: Timer6 Current Value Size: 8-32 bits Address Offset: 104 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400068h	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	<b>TIMER6CURRENTVAL:</b> Current Value of Timer6. This register is supported only when timer_6_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

#### 14.19.1.28 TIMER6CONTROLREG — Offset 4840006Ch

Timer6 Control Register - Name: Timer6 Control Register Size: 4 bits Address Offset: 108 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer6. You can program each Timer6ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	4840006Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>TIMER_PWM:</b> Pulse Width Modulation of timer_6_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	<b>TIMER_INTERRUPT_MASK:</b> Timer interrupt mask for Timer6. 0: not masked 1: masked
1	0h RW	<b>TIMER_MODE:</b> Timer mode for Timer6. 0: free-running mode 1: user-defined count mode NOTE: You must set the Timer6LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	<b>TIMER_ENABLE:</b> Timer enable bit for Timer6. 0: disable 1: enable

#### 14.19.1.29 TIMER6EOI — Offset 48400070h

Timer6 End-of-Interrupt Register - Name: Timer6 End-of-Interrupt Register Size: 1 bit Address Offset: 112 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400070h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER6EOI:</b> Reading from this register returns all zeroes (0) and clears the interrupt from Timer6.

#### 14.19.1.30 TIMER6INTSTAT — Offset 48400074h

Timer6 Interrupt Status Register - Name: Timer6 Interrupt Status Register Size: 1 bit Address Offset: 116 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400074h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER6INTSTAT:</b> Contains the interrupt status for Timer6.

#### 14.19.1.31 TIMER7LOADCOUNT — Offset 48400078h

Timer7 Load Count Register - Name: Timer7 Load Count Register Size: 8-32 bits Address Offset: 120 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	48400078h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER7LOADCOUNT:</b> Value to be loaded into Timer7. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

#### 14.19.1.32 TIMER7CURRENTVAL — Offset 4840007Ch

Timer7 Current Register - Name: Timer7 Current Value Size: 8-32 bits Address Offset: 124 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	4840007Ch	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	<b>TIMER7CURRENTVAL:</b> Current Value of Timer7. This register is supported only when timer_7_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

#### 14.19.1.33 TIMER7CONTROLREG — Offset 48400080h

Timer7 Control Register - Name: Timer7 Control Register Size: 4 bits Address Offset: 128 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer7. You can program each Timer7ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	48400080h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>TIMER_PWM:</b> Pulse Width Modulation of timer_7_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	<b>TIMER_INTERRUPT_MASK:</b> Timer interrupt mask for Timer7. 0: not masked 1: masked
1	0h RW	<b>TIMER_MODE:</b> Timer mode for Timer7. 0: free-running mode 1: user-defined count mode NOTE: You must set the Timer7LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	<b>TIMER_ENABLE:</b> Timer enable bit for Timer7. 0: disable 1: enable

#### 14.19.1.34 TIMER7EOI — Offset 48400084h

Timer7 End-of-Interrupt Register - Name: Timer7 End-of-Interrupt Register Size: 1 bit  
Address Offset: 132 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400084h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER7EOI:</b> Reading from this register returns all zeroes (0) and clears the interrupt from Timer7.

#### 14.19.1.35 TIMER7INTSTAT — Offset 48400088h

Timer7 Interrupt Status Register - Name: Timer7 Interrupt Status Register Size: 1 bit  
Address Offset: 136 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400088h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER7INTSTAT:</b> Contains the interrupt status for Timer7.

#### 14.19.1.36 TIMER8LOADCOUNT — Offset 4840008Ch

Timer8 Load Count Register - Name: Timer8 Load Count Register Size: 8-32 bits  
Address Offset: 140 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	4840008Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER8LOADCOUNT:</b> Value to be loaded into Timer8. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.

#### 14.19.1.37 TIMER8CURRENTVAL — Offset 48400090h

Timer8 Current Value - Name: Timer8 Current Value Size: 8-32 bits Address Offset: 144 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400090h	80000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	80000000h RO/V	<b>TIMER8CURRENTVAL:</b> Current Value of Timer8. This register is supported only when timer_8_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.

#### 14.19.1.38 TIMER8CONTROLREG — Offset 48400094h

Timer8 Control Register - Name: Timer8 Control Register Size: 4 bits Address Offset: 148 Read/Write Access: Read/Write This register controls enabling, operating mode (free-running or defined-count), and interrupt mask of Timer8. You can program each Timer8ControlReg to enable or disable a specific timer and to control its mode of operation.

Type	Size	Offset	Default
MMIO	32 bit	48400094h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>TIMER_PWM:</b> Pulse Width Modulation of timer_8_toggle output. 0: Disabled 1: Enabled This field is only present when TIM_NEWMODE is enabled
2	0h RW	<b>TIMER_INTERRUPT_MASK:</b> Timer interrupt mask for Timer8. 0: not masked 1: masked
1	0h RW	<b>TIMER_MODE:</b> Timer mode for Timer8. 0: free-running mode 1: user-defined count mode NOTE: You must set the Timer8LoadCount register to all 1s before enabling the timer in free-running mode.
0	0h RW	<b>TIMER_ENABLE:</b> Timer enable bit for Timer8. 0: disable 1: enable

#### 14.19.1.39 TIMER8EOI — Offset 48400098h

Timer8 End-of-Interrupt Register - Name: Timer8 End-of-Interrupt Register Size: 1 bit  
Address Offset: 152 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	48400098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER8EOI:</b> Reading from this register returns all zeroes (0) and clears the interrupt from Timer8.

#### 14.19.1.40 TIMER8INTSTAT — Offset 4840009Ch

Timer8 Interrupt Status Register - Name: Timer8 Interrupt Status Register Size: 1 bit  
Address Offset: 156 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	4840009Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>TIMER8INTSTAT:</b> Contains the interrupt status for Timer8.

#### 14.19.1.41 TIMERSINTSTAT – Offset 484000A0h

Timers Interrupt Status Register - Name: Timers Interrupt Status Register Size: 1-8 bits Address Offset: 0xa0 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	484000A0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RO/V	<b>TIMERSINTSTAT:</b> Contains the interrupt status of all timers in the component. If a bit of this register is 0, then the corresponding timer interrupt is not active and the corresponding interrupt could be on either the timer_intr bus or the timer_intr_n bus, depending on the interrupt polarity you have chosen. Similarly, if a bit of this register is 1, then the corresponding interrupt bit has been set in the relevant interrupt bus. In both cases, the status reported is the status after the interrupt mask has been applied. Reading from this register does not clear any active interrupts: 0 = either timer_intr or timer_intr_n is not active after masking 1 = either timer_intr or timer_intr_n is active after masking.

#### 14.19.1.42 TIMERSEOI – Offset 484000A4h

Timers End-of-Interrupt Register - Name: Timers End-of-Interrupt Register Size: 1-8 bits Address Offset: 0xa4 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	484000A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RO/V	<b>TIMERSEOI:</b> Reading this register returns all zeroes (0) and clears all active interrupts.

#### 14.19.1.43 TIMERSRAWINTSTAT — Offset 484000A8h

Timers Raw Interrupt Status Register - Name: Timers Raw Interrupt Status Register  
 Size: 1-8 bits Address Offset: 0xa8 Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	484000A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RO/V	<b>TIMERSRAWINTSTAT:</b> The register contains the unmasked interrupt status of all timers in the component. 0 = either timer_intr or timer_intr_n is not active prior to masking 1 = either timer_intr or timer_intr_n is active prior to masking.

#### 14.19.1.44 TIMERSCOMPVERSION — Offset 484000ACh

Timers Component Version - Name: Timers Component Version Size: 32 bits Address Offset: 0xac Read/Write Access: Read

Type	Size	Offset	Default
MMIO	32 bit	484000ACh	3231302Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	3231302Ah RO/V	<b>TIMERSCOMPVERSION:</b> Current revision number of the DW_apb_timers component.

#### 14.19.1.45 TIMER1LOADCOUNT2 — Offset 484000B0h

Timer1 Load Count2 Register - Name: Timer1 Load Count2 Register Size: 8-32 bits  
Address Offset: 0xb0 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	484000B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER1LOADCOUNT2:</b> Value to be loaded into Timer1 when timer_1_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_1_toggle output.

#### 14.19.1.46 TIMER2LOADCOUNT2 — Offset 484000B4h

Timer2 Load Count2 Register - Name: Timer2 Load Count2 Register Size: 8-32 bits  
Address Offset: 180 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	484000B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER2LOADCOUNT2:</b> Value to be loaded into Timer2 when timer_2_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_2_toggle output.

#### 14.19.1.47 TIMER3LOADCOUNT2 – Offset 484000B8h

Timer3 Load Count2 Register - Name: Timer3 Load Count2 Register Size: 8-32 bits  
Address Offset: 184 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	484000B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER3LOADCOUNT2:</b> Value to be loaded into Timer3 when timer_3_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_3_toggle output.

#### 14.19.1.48 TIMER4LOADCOUNT2 – Offset 484000BCh

Timer4 Load Count2 Register - Name: Timer4 Load Count2 Register Size: 8-32 bits  
Address Offset: 188 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	484000BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER4LOADCOUNT2:</b> Value to be loaded into Timer4 when timer_4_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_4_toggle output.

#### 14.19.1.49 TIMER5LOADCOUNT2 — Offset 484000C0h

Timer5 Load Count2 Register - Name: Timer5 Load Count2 Register Size: 8-32 bits  
Address Offset: 192 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	484000C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER5LOADCOUNT2:</b> Value to be loaded into Timer5 when timer_5_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_5_toggle output.

#### 14.19.1.50 TIMER6LOADCOUNT2 — Offset 484000C4h

Timer6 Load Count2 Register - Name: Timer6 Load Count2 Register Size: 8-32 bits  
Address Offset: 196 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	484000C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER6LOADCOUNT2:</b> Value to be loaded into Timer6 when timer_6_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_6_toggle output.

#### 14.19.1.51 TIMER7LOADCOUNT2 – Offset 484000C8h

Timer7 Load Count2 Register - Name: Timer7 Load Count2 Register Size: 8-32 bits  
Address Offset: 200 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	484000C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER7LOADCOUNT2:</b> Value to be loaded into Timer7 when timer_7_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_7_toggle output.

#### 14.19.1.52 TIMER8LOADCOUNT2 – Offset 484000CCh

Timer8 Load Count2 Register - Name: Timer8 Load Count2 Register Size: 8-32 bits  
Address Offset: 204 Read/Write Access: Read/Write

Type	Size	Offset	Default
MMIO	32 bit	484000CCh	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TIMER8LOADCOUNT2:</b> Value to be loaded into Timer8 when timer_8_toggle output changes from 0 to 1. This value determines the width of the HIGH period of the timer_8_toggle output.

## 14.20 ADC Registers

The ADC registers contain ADC\_DMA, ADC and ADC\_FIFO.

ADC Registers	Address Offset	Table
ADC_DMA	48500000h - 4850000Ch	Table 13-39
ADC	48500400h - 4850049Ch	Table 13-40
ADC_FIFO	48500800h	Table 13-41

### 14.20.1 ADC\_DMA Registers Summary

Table 14-39. Summary of ADC\_DMA Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48500000h	4	REG ADC_DMA_CTRL (ADC_DMA_CTRL)	00000020h
48500004h	4	REG ADC_FIFO_STTS (ADC_FIFO_STTS)	00000000h
48500008h	4	REG ADC_DMA_DEBUG (ADC_DMA_DEBUG)	00000000h
4850000Ch	4	REG ADC_PWR_STAT (ADC_PWR_STAT)	00000000h

#### 14.20.1.1 REG ADC\_DMA\_CTRL (ADC\_DMA\_CTRL) – Offset 48500000h

DMA Control Register

Type	Size	Offset	Default
MMIO	32 bit	48500000h	00000020h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	<b>Reserved</b>
10:1	010h RW	<b>DMA_BRST_THRESHLD:</b> When DMA is enabled the value must be 0x10. When ADC FIFO entries exceed the 0x16 then a DMA burst transaction is requested. FIFO threshold interrupt is also generated. If fifo is not emptied before clearing the interrupt next interrupt may not be generated. If dma is disabled the value can be 0x1 to 0x228
0	0h RW	<b>DMA_EN:</b> Setting this bit enables the DMA interface 1b0 DMA Interface disabled 1b0 DMA Interface enabled

#### 14.20.1.2 REG ADC\_FIFO\_STTS (ADC\_FIFO\_STTS) – Offset 48500004h

FIFO Status Register

Type	Size	Offset	Default
MMIO	32 bit	48500004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	<b>Reserved</b>
9:0	000h RO/V	<b>FIFO_COUNT:</b> FIFO entry count - indicates the current number of entries in the FIFO from the perspective of the read interface. Valid values: 0 - 514.

#### 14.20.1.3 REG ADC\_DMA\_DEBUG (ADC\_DMA\_DEBUG) – Offset 48500008h

FIFO Status Register

Type	Size	Offset	Default
MMIO	32 bit	48500008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RO/V	<b>DMA_BURST:</b> Burst transaction request. The dma_burst signal is a status signal and is asserted by ADC when it can transmit at least the number of source data items as specified by DMA_CTRL.THLD.
0	0h RO/V	<b>DMA_SINGLE:</b> Single transfer status. The dma_single signal is a status signal and is asserted by ADC when it can transmit at least one source data item.

#### 14.20.1.4 REG ADC\_PWR\_STAT (ADC\_PWR\_STAT) – Offset 4850000Ch

Returns power good status of the ADC

Type	Size	Offset	Default
MMIO	32 bit	4850000Ch	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>PWR_STAT:</b> Returns power good status of the ADC 1: Power good 0: ADC powered down

## 14.20.2 ADC Registers Summary

Table 14-40. Summary of ADC Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48500400h	4	REG_ADC_CTRL (ADC_CTRL)	00000010h
48500404h	4	REG_ADC_LOOP_CTRL (ADC_LOOP_CTRL)	00700000h
48500408h	4	REG_ADC_LOOP_SEQ (ADC_LOOP_SEQ)	76543210h
4850040Ch	4	REG_ADC_LOOP_DELAY (ADC_LOOP_DELAY_0)	00000000h
48500410h	4	REG_ADC_LOOP_DELAY (ADC_LOOP_DELAY_1)	00000000h
48500414h	4	REG_ADC_LOOP_DELAY (ADC_LOOP_DELAY_2)	00000000h
48500418h	4	REG_ADC_LOOP_DELAY (ADC_LOOP_DELAY_3)	00000000h
4850041Ch	4	REG_ADC_LOOP_DELAY (ADC_LOOP_DELAY_4)	00000000h
48500420h	4	REG_ADC_LOOP_DELAY (ADC_LOOP_DELAY_5)	00000000h
48500424h	4	REG_ADC_LOOP_DELAY (ADC_LOOP_DELAY_6)	00000000h
48500428h	4	REG_ADC_LOOP_DELAY (ADC_LOOP_DELAY_7)	00000000h
4850042Ch	4	REG_ADC_CAL_CTRL (ADC_CAL_CTRL)	00000000h
48500430h	4	REG_ADC_CONV_CTRL (ADC_CONV_CTRL)	00000000h
48500434h	4	REG_ADC_CONV_DELAY (ADC_CONV_DELAY)	00000000h
48500438h	4	REG_ADC_CONFIG1 (ADC_CONFIG1)	A0848041h
4850043Ch	4	REG_ADC_CONFIG2 (ADC_CONFIG2)	0000000Ah
48500440h	4	REG_ADC_FIFO_CTRL (ADC_FIFO_CTRL)	00000000h
48500444h	4	REG_ADC_STAT (ADC_STAT)	00000000h
48500448h	4	REG_ADC_FIFO_RD_POINTER (ADC_FIFO_RD_POINTER)	00000000h
4850044Ch	4	REG_ADC_RAW_DATA (ADC_RAW_DATA)	00000000h
48500450h	4	REG_ADC_DATA_THRESHOLD (ADC_DATA_THRESHOLD_0)	0000FFFFh
48500454h	4	REG_ADC_DATA_THRESHOLD (ADC_DATA_THRESHOLD_1)	0000FFFFh
48500458h	4	REG_ADC_DATA_THRESHOLD (ADC_DATA_THRESHOLD_2)	0000FFFFh
4850045Ch	4	REG_ADC_DATA_THRESHOLD (ADC_DATA_THRESHOLD_3)	0000FFFFh
48500460h	4	REG_ADC_DATA_THRESHOLD (ADC_DATA_THRESHOLD_4)	0000FFFFh
48500464h	4	REG_ADC_DATA_THRESHOLD (ADC_DATA_THRESHOLD_5)	0000FFFFh
48500468h	4	REG_ADC_DATA_THRESHOLD (ADC_DATA_THRESHOLD_6)	0000FFFFh
4850046Ch	4	REG_ADC_DATA_THRESHOLD (ADC_DATA_THRESHOLD_7)	0000FFFFh
48500470h	4	REG_ADC_THRESHOLD_CONFIG_r (ADC_THRESHOLD_CONFIG)	00000000h
48500474h	4	REG_ADC_RIS (ADC_RIS)	00000000h
48500478h	4	REG_ADC_IMSC (ADC_IMSC)	00000001h
4850047Ch	4	REG_ADC_MIS (ADC_MIS)	00000000h
48500480h	4	REG_ADC_LOOP_CFG (ADC_LOOP_CFG_0)	00000000h
48500484h	4	REG_ADC_LOOP_CFG (ADC_LOOP_CFG_1)	00000000h
48500488h	4	REG_ADC_LOOP_CFG (ADC_LOOP_CFG_2)	00000000h
4850048Ch	4	REG_ADC_LOOP_CFG (ADC_LOOP_CFG_3)	00000000h
48500490h	4	REG_ADC_LOOP_CFG (ADC_LOOP_CFG_4)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48500494h	4	REG ADC_LOOP_CFG (ADC_LOOP_CFG_5)	00000000h
48500498h	4	REG ADC_LOOP_CFG (ADC_LOOP_CFG_6)	00000000h
4850049Ch	4	REG ADC_LOOP_CFG (ADC_LOOP_CFG_7)	00000000h

#### 14.20.2.1 REG ADC\_CTRL (ADC\_CTRL) – Offset 48500400h

Control register for ADC

Type	Size	Offset	Default
MMIO	32 bit	48500400h	00000010h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	1h RW	<b>DISABLE_IN_WAIT:</b> Disable samples when in wait states when this bit set conv_en to the ADC is deasserted during WAIT and WAIT_SLOT
3	0h RO	<b>Reserved</b>
2:1	0h RW	<b>DATA_THRESHOLD_MODE:</b> Data Threshold Mode 2b00 Data Threshold Mode disabled 2b01 Passive Data Threshold Mode enabled. All data samples are stored in the ADC FIFO and interrupt is triggered when the Threshold is exceeded 2b10 Active Data Threshold Mode enabled. Data samples stored only when data threshold is exceeded and interrupt signaled 2b11 - Reserved
0	0h RW	<b>ENABLE:</b> This bit when set enables FSM of the ADC controller to perform sampling,

#### 14.20.2.2 REG ADC\_LOOP\_CTRL (ADC\_LOOP\_CTRL) – Offset 48500404h

Control loop register for ADC

Type	Size	Offset	Default
MMIO	32 bit	48500404h	00700000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	<b>Reserved</b>
22:20	7h RW	<b>NUM_SLOTS:</b> Enables slots 0 to NUM_SLOTS. Valid values 0 to 7
19:17	0h RO	<b>Reserved</b>
16	0h RW/V	<b>LOOP_MODE_START:</b> Must be set after loop configuration is complete. Set by software and cleared by hardware
15:14	0h RO	<b>Reserved</b>
13:4	000h RW	<b>NUM_LOOP:</b> ADC Controller will Loop for the number of loops defined in NUM_LOOPS + 1
3:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>LOOP_MODE_EN:</b> 2b00 Loop Mode Disabled 2b01 Continuous Loop Mode. ADC will continue in loop mode until ADC_CTRL.EN bit is cleared. 2b10 Defined Loop Mode. ADC will loop for the number of loops defined in ADC_CTRL.NUM_LOOPS+1

#### 14.20.2.3 REG ADC\_LOOP\_SEQ (ADC\_LOOP\_SEQ) – Offset 48500408h

Channel sequence of a loop for ADC. The ADC controller will loop through 0- NUM\_SLOTS in this

loop sequence. Note that channel values could start and stop at any channels, channels could be repeated. A channel can be skipped by not programming it in this register.

Set max number of channels in ADC\_LOOP\_CTRL.NUM\_SLOTS register

Type	Size	Offset	Default
MMIO	32 bit	48500408h	76543210h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved</b>
30:28	7h RW	<b>EIGHTH_CHNL:</b> Slot 7. Eighth channel that the ADC controller samples when in loop mode
27	0h RO	<b>Reserved</b>
26:24	6h RW	<b>SEVENTH_CHNL:</b> Slot 6. Seventh channel that the ADC controller samples when in loop mode
23	0h RO	<b>Reserved</b>
22:20	5h RW	<b>SIXTH_CHNL:</b> Slot 5. Sixth channel that the ADC controller samples when in loop mode
19	0h RO	<b>Reserved</b>
18:16	4h RW	<b>FIFTH_CHNL:</b> Slot 4. Fifth channel that the ADC controller samples when in loop mode
15	0h RO	<b>Reserved</b>
14:12	3h RW	<b>FOURTH_CHNL:</b> Slot 3. Fourth channel that the ADC controller samples when in loop mode
11	0h RO	<b>Reserved</b>
10:8	2h RW	<b>THIRD_CHNL:</b> Slot 2. Third channel that the ADC controller samples when in loop mode
7	0h RO	<b>Reserved</b>
6:4	1h RW	<b>SECOND_CHNL:</b> Slot 1. Second channel that the ADC controller samples when in loop mode
3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>FIRST_CHNL:</b> Slot 0. First channel that the ADC controller samples when in loop mode

#### 14.20.2.4 REG ADC\_LOOP\_DELAY (ADC\_LOOP\_DELAY\_0) – Offset 4850040Ch

Conversion delay register for ADC in LOOP mode. Use for inserting delays between slots.

Type	Size	Offset	Default
MMIO	32 bit	4850040Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>NUM_WAIT:</b> NUM_WAIT number of wait cycles after the slot conversion. Used in LOOP mode after present slot When NUM_WAIT is 0x0 the conversion rate is the Max Rate and there is no delay between conversion triggers. When NUM_WAIT is non-zero the delay between slots is NUM_WAIT * sample_delay. sample_delay = 64 ADC clocks = 512ns. FSM moves to CONV_DISCARD after wait in WAIT_SLOT state. This triggers conversion. After trigger 2 samples are discarded in CONV_DISCARD Effectively total delay = (NUM_WAIT* sample_delay) + (2* sample_delay) hence minimum possible non-zero delay is of 3 samples.

#### 14.20.2.5 REG ADC\_LOOP\_DELAY (ADC\_LOOP\_DELAY\_1) – Offset 48500410h

Conversion delay register for ADC in LOOP mode. Use for inserting delays between slots.

**Note:** Bit definitions are the same as ADC\_LOOP\_DELAY\_0, offset 4850040Ch.

#### 14.20.2.6 REG ADC\_LOOP\_DELAY (ADC\_LOOP\_DELAY\_2) – Offset 48500414h

Conversion delay register for ADC in LOOP mode. Use for inserting delays between slots.

**Note:** Bit definitions are the same as ADC\_LOOP\_DELAY\_0, offset 4850040Ch.

#### 14.20.2.7 REG ADC\_LOOP\_DELAY (ADC\_LOOP\_DELAY\_3) – Offset 48500418h

Conversion delay register for ADC in LOOP mode. Use for inserting delays between slots.

**Note:** Bit definitions are the same as ADC\_LOOP\_DELAY\_0, offset 4850040Ch.

#### 14.20.2.8 REG ADC\_LOOP\_DELAY (ADC\_LOOP\_DELAY\_4) – Offset 4850041Ch

Conversion delay register for ADC in LOOP mode. Use for inserting delays between slots.

**Note:** Bit definitions are the same as ADC\_LOOP\_DELAY\_0, offset 4850040Ch.

#### 14.20.2.9 REG ADC\_LOOP\_DELAY (ADC\_LOOP\_DELAY\_5) – Offset 48500420h

Conversion delay register for ADC in LOOP mode. Use for inserting delays between slots.

**Note:** Bit definitions are the same as ADC\_LOOP\_DELAY\_0, offset 4850040Ch.

#### 14.20.2.10 REG ADC\_LOOP\_DELAY (ADC\_LOOP\_DELAY\_6) – Offset 48500424h

Conversion delay register for ADC in LOOP mode. Use for inserting delays between slots.

**Note:** Bit definitions are the same as ADC\_LOOP\_DELAY\_0, offset 4850040Ch.

#### 14.20.2.11 REG ADC\_LOOP\_DELAY (ADC\_LOOP\_DELAY\_7) – Offset 48500428h

Conversion delay register for ADC in LOOP mode. Use for inserting delays between slots.

**Note:** Bit definitions are the same as ADC\_LOOP\_DELAY\_0, offset 4850040Ch.

#### 14.20.2.12 REG ADC\_CAL\_CTRL (ADC\_CAL\_CTRL) – Offset 4850042Ch

Calibration Control register for ADC

Type	Size	Offset	Default
MMIO	32 bit	4850042Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	<b>Reserved</b>
10:4	00h RW/V	<b>ADD_OFFSET:</b> ADD_OFFSET(6) is the sign bit. ADD_OFFSET<5:0> is the magnitude bit. Calibrated values are loaded by default
3:2	0h RO	<b>Reserved</b>
1	0h RW	<b>CAL_CTRL:</b> valid only when CAL_EN=1. When CAL_CTRL=0, vinp=vrefn & vinn = vccvref_lv. When CAL_CTRL=1, vinp=vcm & vinn = vcm.
0	0h RW	<b>CAL_EN:</b> Enables calibration mode

#### 14.20.2.13 REG ADC\_CONV\_CTRL (ADC\_CONV\_CTRL) – Offset 48500430h

Conversion Control register for ADC

Type	Size	Offset	Default
MMIO	32 bit	48500430h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	<b>Reserved</b>
17:8	000h RW	<b>NUM_SMPL:</b> NUM_SMPL Number of Conversion cycles that the ADC is required to perform. Applicable only if the CONV_MODE bit is set. 0b00_0000_0000 1 Sample 0b00_0000_0001 2 Samples .. 0b11_1111_1111 1024 Samples.
7:5	0h RO	<b>Reserved</b>
4	0h RW	<b>CONV_MODE:</b> CONV_MODE defines if the ADC should continuously sample and convert as long as the ADC_CTRL.EN bit is set or sample and convert for as many times as defined in the NUM_SMPL field. Mode must be defined before the REQ bit is set by software. 0 Continuous mode 1 Number of samples mode. As many samples as defined in the NUM_SMPL field Applicable only in single channel mode.
3:1	0h RO	<b>Reserved</b>
0	0h RW/V	<b>REQ:</b> Set by software by writing 1b1 to enable the ADC to begin sampling and converting in single channel mode. The REQ bit is cleared by hardware once the number of samples request have been completed or if the ADC_CTRL.EN bit is cleared. Write of 1b0 by software has no effect.

#### 14.20.2.14 REG ADC\_CONV\_DELAY (ADC\_CONV\_DELAY) – Offset 48500434h

Conversion delay register for ADC between successive samples

Type	Size	Offset	Default
MMIO	32 bit	48500434h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>NUM_WAIT:</b> NUM_WAIT number of wait cycles between conversions. When NUM_WAIT is 0x0 the conversion rate is the Max Rate and there is no delay between conversion triggers. When NUM_WAIT is non-zero the delay between conversion triggers is NUM_WAIT* sample_delay. sample_delay = 64 ADC clocks = 512ns. FSM moves to CONV_DISCARD after wait in WATI state. This triggers conversion. After trigger 2 samples are discarded in CONV_DISCARD Effectively total delay = (NUM_WAIT* sample_delay) + (2* sample_delay) hence minimum possible non-zero delay is of 3 samples.

#### 14.20.2.15 REG ADC\_CONFIG1 (ADC\_CONFIG1) — Offset 48500438h

Configuration register for ADC

Type	Size	Offset	Default
MMIO	32 bit	48500438h	A0848041h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	2h RW/V	<b>ATTEN_TRIM:</b> Input signal attenuation. Default value is loaded from fuse 00: no attenuation 01: vin = 3/4*ain 10: vin = 2/3*ain 11: vin = 1/2*ain
29:28	2h RW/V	<b>INBUF_CUR:</b> Input buffer current control bits
27:25	0h RO	<b>Reserved</b>
24	0h RW	<b>BG_BYPASS:</b> When BG_BYPASS=1,select bandgap circuit. When BG_BYPASS=0,select resistor divider.

Bit Range	Default & Access	Field Name (ID): Description
23:19	10h RW/V	<b>BG_TRIM:</b> Bandgap output coarse trimming bits. Default value is loaded from fuse
18:16	4h RW/V	<b>BG_CTRIM:</b> Bandgap output fine trimming bits. Default value is loaded from fuse
15:8	80h RW/V	<b>REF_TRIM:</b> Reference output (vrefp) trimming bits. Can skip bandgap trimming and directly apply trimming to vrefp. Default value is loaded from fuse.
7	0h RO	<b>Reserved</b>
6	1h RW	<b>ADC_RESET:</b> The ADC controller drives reset to the ADC. 1 : reset. 0 : out of reset
5	0h RW	<b>REF_BYPASS_EN:</b> when REF_BYPASS_EN = 1 reference bypass is enabled, vrefp=vddana. when REF_BYPASS_EN = 0 vrefp is high Z.
4	0h RW	<b>REF_EN:</b> Reference generation is enabled when REF_EN = 1 & REF_BYPASS_EN = 0. When, REF_EN = 0 & REF_BYPASS_EN = 0, vrefp is high Z.
3:1	0h RW	<b>CHNL_SEL:</b> Determines which of the 8 (or 4 differential) channels are being sampled CH0_SINGLE = 0x0 CH1_SINGLE = 0x1 CH2_SINGLE = 0x2 CH3_SINGLE = 0x3 CH4_SINGLE = 0x4 CH5_SINGLE = 0x5 CH6_SINGLE = 0x6 CH7_SINGLE = 0x7 CH0_DIFF = 0x0 CH1_DIFF = 0x2 CH2_DIFF = 0x4 CH3_DIFF = 0x6
0	1h RW	<b>DIFF_SE_SEL:</b> Selects the ADC input mode 0x1 Single Ended Mode 0x0 Differential Mode

#### 14.20.2.16 REG ADC\_CONFIG2 (ADC\_CONFIG2) — Offset 4850043Ch

Configuration register for ADC

Type	Size	Offset	Default
MMIO	32 bit	4850043Ch	0000000Ah

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11:4	00h RW/V	<b>ADC_INT_CONFIG:</b> Cal config. Default value is loaded from fuse.
3:2	2h RW	<b>NS_EN:</b> Nssar noise shaping enable
1:0	2h RW	<b>MS_EN:</b> NSSAR capacitor mismatch shaping enable

#### 14.20.2.17 REG ADC\_FIFO\_CTRL (ADC\_FIFO\_CTRL) – Offset 48500440h

Control register for ADC FIFO

Type	Size	Offset	Default
MMIO	32 bit	48500440h	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	<b>Reserved</b>
17:8	000h RW	<b>TMSTMP_EN:</b> Enable Time Stamp to be written to the ADC FIFO. If set to zero then no Time Stamp is inserted else Time Stamp is inserted after every TMSTMP number of samples.
7:2	0h RO	<b>Reserved</b>
1	0h RW	<b>FIFO_WR_DIS:</b> Setting this bit disables write to the ADC FIFO
0	0h RW/1S/V	<b>FIFO_RESET:</b> Used to reset the FIFO pointer back to zero and clear overflow and underflow flags

### 14.20.2.18 REG ADC\_STAT (ADC\_STAT) – Offset 48500444h

Status register for ADC

Type	Size	Offset	Default
MMIO	32 bit	48500444h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20	0h RO/V	<b>CONV_IN_PRGRSS:</b> Indicates if a conversion is in progress
19:17	0h RO	<b>Reserved</b>
16	0h RO/V	<b>ADC_IDLE:</b> ADC is in IDLE state
15:10	0h RO	<b>Reserved</b>
9:0	000h RO/V	<b>ADC_FIFO_VALID_ENTRIES:</b> Total word count in the RAM and cache. Refer in DW FIFO datasheet fifo_word_cnt_s for more details

### 14.20.2.19 REG ADC\_FIFO\_RD\_POINTER (ADC\_FIFO\_RD\_POINTER) – Offset 48500448h

Status register for ADC FIFO read pointer

Type	Size	Offset	Default
MMIO	32 bit	48500448h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	<b>Reserved</b>
9:0	000h RO/V	<b>RD_POINTER:</b> Status register for ADC FIFO read pointer

#### 14.20.2.20 REG ADC\_RAW\_DATA (ADC\_RAW\_DATA) — Offset 4850044Ch

Raw data out of the ADC

Type	Size	Offset	Default
MMIO	32 bit	4850044Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	<b>Reserved</b>
18:16	0h RO/V	<b>CH_NUM:</b> Channel number
15:0	0000h RO/V	<b>ADC_DATA:</b> Returns raw valid data out of the ADC.

#### 14.20.2.21 REG ADC\_DATA\_THRESHOLD (ADC\_DATA\_THRESHOLD\_0) — Offset 48500450h

ADC Data Threshold register

Type	Size	Offset	Default
MMIO	32 bit	48500450h	0000FFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>DATA_THRSHLD_LOW:</b> ADC controller compares this values with the sampled digital output and triggers an interrupt if the sampled signal is below the threshold
15:0	FFFFh RW	<b>DATA_THRSHLD_HIGH:</b> ADC controller compares this values with the sampled digital output and triggers an interrupt if the sampled signal is above the threshold

#### 14.20.2.22 REG ADC\_DATA\_THRESHOLD (ADC\_DATA\_THRESHOLD\_1) — Offset 48500454h

ADC Data Threshold register

**Note:** Bit definitions are the same as ADC\_DATA\_THRESHOLD\_0, offset 48500450h.

**14.20.2.23 REG ADC\_DATA\_THRESHOLD (ADC\_DATA\_THRESHOLD\_2) — Offset 48500458h**

ADC Data Threshold register

**Note:** Bit definitions are the same as ADC\_DATA\_THRESHOLD\_0, offset 48500450h.

**14.20.2.24 REG ADC\_DATA\_THRESHOLD (ADC\_DATA\_THRESHOLD\_3) — Offset 4850045Ch**

ADC Data Threshold register

**Note:** Bit definitions are the same as ADC\_DATA\_THRESHOLD\_0, offset 48500450h.

**14.20.2.25 REG ADC\_DATA\_THRESHOLD (ADC\_DATA\_THRESHOLD\_4) — Offset 48500460h**

ADC Data Threshold register

**Note:** Bit definitions are the same as ADC\_DATA\_THRESHOLD\_0, offset 48500450h.

**14.20.2.26 REG ADC\_DATA\_THRESHOLD (ADC\_DATA\_THRESHOLD\_5) — Offset 48500464h**

ADC Data Threshold register

**Note:** Bit definitions are the same as ADC\_DATA\_THRESHOLD\_0, offset 48500450h.

**14.20.2.27 REG ADC\_DATA\_THRESHOLD (ADC\_DATA\_THRESHOLD\_6) — Offset 48500468h**

ADC Data Threshold register

**Note:** Bit definitions are the same as ADC\_DATA\_THRESHOLD\_0, offset 48500450h.

**14.20.2.28 REG ADC\_DATA\_THRESHOLD (ADC\_DATA\_THRESHOLD\_7) — Offset 4850046Ch**

ADC Data Threshold register

**Note:** Bit definitions are the same as ADC\_DATA\_THRESHOLD\_0, offset 48500450h.

**14.20.2.29 REG ADC\_THRESHOLD\_CONFIG\_r (ADC\_THRESHOLD\_CONFIG) — Offset 48500470h**

ADC Data Threshold config register

Type	Size	Offset	Default
MMIO	32 bit	48500470h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:8	00h RW	<b>DATA_THRSHLD_LOW_EN:</b> 0 : DATA_THRSHLD_LOW is NOT valid. 1 : DATA_THRSHLD_LOW is valid
7:0	00h RW	<b>DATA_THRSHLD_HIGH_EN:</b> 0: DATA_THRSHLD_HIGH is NOT valid. 1: DATA_THRSHLD_HIGH is valid

#### 14.20.2.30 REG ADC\_RIS (ADC\_RIS) – Offset 48500474h

Interrupt Status register for the ADC. Raw

Type	Size	Offset	Default
MMIO	32 bit	48500474h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23	0h RW/1C/V	<b>FIFO_THRHLD_RAW_INTR:</b> When number of entries in FIFO $\geq$ ADC_DMA_CTRL.DMA_BRST_THRSHLD
22	0h RW/1C/V	<b>FIFO_OVERFLOW_RAW_INTR:</b> ADC FIFO overflows and further samples are discarded. Reset FIFO before clearing this bit
21	0h RW/1C/V	<b>FIFO_UNDERFLOW_RAW_INTR:</b> Set when the ADC FIFO underflow flag is set. Reset FIFO before clearing this bit
20	0h RW/1C/V	<b>DMA_DONE_RAW_INTR:</b> Set when the DMA ACK signal is received by the ADC Controller
19	0h RW/1C/V	<b>DATA_THRSHLD_LOW_RAW_INTR_7:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW/1C/V	<b>DATA_THRSHLD_HIGH_RAW_INTR_7:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
17	0h RW/1C/V	<b>DATA_THRSHLD_LOW_RAW_INTR_6:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
16	0h RW/1C/V	<b>DATA_THRSHLD_HIGH_RAW_INTR_6:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
15	0h RW/1C/V	<b>DATA_THRSHLD_LOW_RAW_INTR_5:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
14	0h RW/1C/V	<b>DATA_THRSHLD_HIGH_RAW_INTR_5:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
13	0h RW/1C/V	<b>DATA_THRSHLD_LOW_RAW_INTR_4:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
12	0h RW/1C/V	<b>DATA_THRSHLD_HIGH_RAW_INTR_4:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
11	0h RW/1C/V	<b>DATA_THRSHLD_LOW_RAW_INTR_3:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
10	0h RW/1C/V	<b>DATA_THRSHLD_HIGH_RAW_INTR_3:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
9	0h RW/1C/V	<b>DATA_THRSHLD_LOW_RAW_INTR_2:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
8	0h RW/1C/V	<b>DATA_THRSHLD_HIGH_RAW_INTR_2:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
7	0h RW/1C/V	<b>DATA_THRSHLD_LOW_RAW_INTR_1:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
6	0h RW/1C/V	<b>DATA_THRSHLD_HIGH_RAW_INTR_1:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
5	0h RW/1C/V	<b>DATA_THRSHLD_LOW_RAW_INTR_0:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
4	0h RW/1C/V	<b>DATA_THRSHLD_HIGH_RAW_INTR_0:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
3	0h RW/1C/V	<b>LOOPS_DONE_RAW_INTR:</b> Set when the ADC controller completes the a number of loops set by LOOP_CTRL register

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C/V	<b>SEQ_DONE_RAW_INTR:</b> Sequence Done Interrupt. Set by hardware whenever sampling for all slots is done. Triggered on end of every loop, before WAIT_SLOT. Valid only in loop mode.
1	0h RW/1C/V	<b>SLOT_DONE_RAW_INTR:</b> Slot Done Interrupt. Set by hardware when all samples for the current channel/slot is done
0	0h RW/1C/V	<b>SMPL_DONE_RAW_INTR:</b> Sample Done Interrupt. Set by hardware whenever the current sample request is done

#### 14.20.2.31 REG ADC\_IMSC (ADC\_IMSC) – Offset 48500478h

Interrupt mask register for the ADC

Type	Size	Offset	Default
MMIO	32 bit	48500478h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23	0h RW	<b>FIFO_THRHLD_INTR_MASK:</b> 0: Not Masked 1: Interrupt Masked
22	0h RW	<b>FIFO_OVERFLOW_INTR_MASK:</b> 0: Not Masked 1: Interrupt Masked
21	0h RW	<b>FIFO_UNDERFLOW_INTR_MASK:</b> 0: Not Masked 1: Interrupt Masked
20	0h RW	<b>DMA_DONE_INTR_MASK:</b> 0: Not Masked 1: Interrupt Masked
19	0h RW	<b>DATA_THRHLD_LOW_INTR_MASK_7:</b> 0: Not Masked 1: Interrupt Masked
18	0h RW	<b>DATA_THRHLD_HIGH_INTR_MASK_7:</b> 0: Not Masked 1: Interrupt Masked
17	0h RW	<b>DATA_THRHLD_LOW_INTR_MASK_6:</b> 0: Not Masked 1: Interrupt Masked

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	<b>DATA_THRSHLD_HIGH_INTR_MASK_6:</b> 0: Not Masked 1: Interrupt Masked
15	0h RW	<b>DATA_THRSHLD_LOW_INTR_MASK_5:</b> 0: Not Masked 1: Interrupt Masked
14	0h RW	<b>DATA_THRSHLD_HIGH_INTR_MASK_5:</b> 0: Not Masked 1: Interrupt Masked
13	0h RW	<b>DATA_THRSHLD_LOW_INTR_MASK_4:</b> 0: Not Masked 1: Interrupt Masked
12	0h RW	<b>DATA_THRSHLD_HIGH_INTR_MASK_4:</b> 0: Not Masked 1: Interrupt Masked
11	0h RW	<b>DATA_THRSHLD_LOW_INTR_MASK_3:</b> 0: Not Masked 1: Interrupt Masked
10	0h RW	<b>DATA_THRSHLD_HIGH_INTR_MASK_3:</b> 0: Not Masked 1: Interrupt Masked
9	0h RW	<b>DATA_THRSHLD_LOW_INTR_MASK_2:</b> 0: Not Masked 1: Interrupt Masked
8	0h RW	<b>DATA_THRSHLD_HIGH_INTR_MASK_2:</b> 0: Not Masked 1: Interrupt Masked
7	0h RW	<b>DATA_THRSHLD_LOW_INTR_MASK_1:</b> 0: Not Masked 1: Interrupt Masked
6	0h RW	<b>DATA_THRSHLD_HIGH_INTR_MASK_1:</b> 0: Not Masked 1: Interrupt Masked
5	0h RW	<b>DATA_THRSHLD_LOW_INTR_MASK_0:</b> 0: Not Masked 1: Interrupt Masked
4	0h RW	<b>DATA_THRSHLD_HIGH_INTR_MASK_0:</b> 0: Not Masked 1: Interrupt Masked
3	0h RW	<b>LOOPS_DONE_INTR_MASK:</b> 0: Not Masked 1: Interrupt Masked

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	<b>SEQ_DONE_INTR_MASK:</b> 0: Not Masked 1: Interrupt Masked
1	0h RW	<b>SLOT_DONE_INTR_MASK:</b> 0: Not Masked 1: Interrupt Masked
0	1h RW	<b>SMPL_DONE_INTR_MASK:</b> 0: Not Masked 1: Interrupt Masked

#### 14.20.2.32 REG ADC\_MIS (ADC\_MIS) — Offset 4850047Ch

Interrupt Status register for the ADC. After masking.

Type	Size	Offset	Default
MMIO	32 bit	4850047Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23	0h RO/V	<b>FIFO_THRHLD_INTR:</b> When number of entries in FIFO == ADC_DMA_CTRL.DMA_BRST_THRSHLD
22	0h RO/V	<b>FIFO_OVERFLOW_INTR:</b> ADC FIFO overflows and further samples are discarded
21	0h RO/V	<b>FIFO_UNDERFLOW_INTR:</b> Set when the ADC FIFO underflow flag is set.
20	0h RO/V	<b>DMA_DONE_INTR:</b> Set when the DMA ACK signal is received by the ADC Controller
19	0h RO/V	<b>DATA_THRHLD_LOW_INTR_7:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRHLD_LOW
18	0h RO/V	<b>DATA_THRHLD_HIGH_INTR_7:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRHLD_HIGH
17	0h RO/V	<b>DATA_THRHLD_LOW_INTR_6:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRHLD_LOW
16	0h RO/V	<b>DATA_THRHLD_HIGH_INTR_6:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRHLD_HIGH

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO/V	<b>DATA_THRSHLD_LOW_INTR_5:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
14	0h RO/V	<b>DATA_THRSHLD_HIGH_INTR_5:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
13	0h RO/V	<b>DATA_THRSHLD_LOW_INTR_4:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
12	0h RO/V	<b>DATA_THRSHLD_HIGH_INTR_4:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
11	0h RO/V	<b>DATA_THRSHLD_LOW_INTR_3:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
10	0h RO/V	<b>DATA_THRSHLD_HIGH_INTR_3:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
9	0h RO/V	<b>DATA_THRSHLD_LOW_INTR_2:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
8	0h RO/V	<b>DATA_THRSHLD_HIGH_INTR_2:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
7	0h RO/V	<b>DATA_THRSHLD_LOW_INTR_1:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
6	0h RO/V	<b>DATA_THRSHLD_HIGH_INTR_1:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
5	0h RO/V	<b>DATA_THRSHLD_LOW_INTR_0:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_LOW
4	0h RO/V	<b>DATA_THRSHLD_HIGH_INTR_0:</b> Sampled Data exceeded the values stored in ADC_DATA_THRESHOLD.DATA_THRSHLD_HIGH
3	0h RO/V	<b>LOOPS_DONE_INTR:</b> Set when the ADC controller completes the a number of loops set by LOOP_CTRL register
2	0h RO/V	<b>SEQ_DONE_INTR:</b> Sequence Done Interrupt. Set by hardware whenever sampling for all slots is done. Triggered on end of every loop, before WAIT_SLOT. Valid only in loop mode.
1	0h RO/V	<b>SLOT_DONE_INTR:</b> Slot Done Interrupt. Set by hardware when all samples for the current channel/slot is done
0	0h RO/V	<b>SMPL_DONE_INTR:</b> Sample Done Interrupt. Set by hardware whenever the current sample request is done

#### 14.20.2.33 REG ADC\_LOOP\_CFG (ADC\_LOOP\_CFG\_0) – Offset 48500480h

Conversion config register for ADC in LOOP mode

Type	Size	Offset	Default
MMIO	32 bit	48500480h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved
9:0	000h RW	<b>NUM_SMPL:</b> NUM_SMPL Number of Conversion cycles that the ADC is required to perform for the slot. 0b00_0000_0000 1 Sample 0b00_0000_0001 2 Samples ... 0b11_1111_1111 1024 Samples.

#### 14.20.2.34 REG ADC\_LOOP\_CFG (ADC\_LOOP\_CFG\_1) – Offset 48500484h

Conversion config register for ADC in LOOP mode

**Note:** Bit definitions are the same as ADC\_LOOP\_CFG\_0, offset 48500480h.

#### 14.20.2.35 REG ADC\_LOOP\_CFG (ADC\_LOOP\_CFG\_2) – Offset 48500488h

Conversion config register for ADC in LOOP mode

**Note:** Bit definitions are the same as ADC\_LOOP\_CFG\_0, offset 48500480h.

#### 14.20.2.36 REG ADC\_LOOP\_CFG (ADC\_LOOP\_CFG\_3) – Offset 4850048Ch

Conversion config register for ADC in LOOP mode

**Note:** Bit definitions are the same as ADC\_LOOP\_CFG\_0, offset 48500480h.

#### 14.20.2.37 REG ADC\_LOOP\_CFG (ADC\_LOOP\_CFG\_4) – Offset 48500490h

Conversion config register for ADC in LOOP mode

**Note:** Bit definitions are the same as ADC\_LOOP\_CFG\_0, offset 48500480h.

#### 14.20.2.38 REG ADC\_LOOP\_CFG (ADC\_LOOP\_CFG\_5) – Offset 48500494h

Conversion config register for ADC in LOOP mode

**Note:** Bit definitions are the same as ADC\_LOOP\_CFG\_0, offset 48500480h.

#### 14.20.2.39 REG ADC\_LOOP\_CFG (ADC\_LOOP\_CFG\_6) – Offset 48500498h

Conversion config register for ADC in LOOP mode

**Note:** Bit definitions are the same as ADC\_LOOP\_CFG\_0, offset 48500480h.

#### 14.20.2.40 REG ADC\_LOOP\_CFG (ADC\_LOOP\_CFG\_7) – Offset 4850049Ch

Conversion config register for ADC in LOOP mode

**Note:** Bit definitions are the same as ADC\_LOOP\_CFG\_0, offset 48500480h.

### 14.20.3 ADC\_FIFO Registers Summary

Table 14-41. Summary of ADC\_FIFO Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48500800h	4	REG_ADC_FIFO_DATA (ADC_FIFO_DATA)	00000000h

#### 14.20.3.1 REG ADC\_FIFO\_DATA (ADC\_FIFO\_DATA) – Offset 48500800h

ADC FIFO data

Type	Size	Offset	Default
MMIO	32 bit	BAR + 48500800h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:0	000000h RO	<b>FIFO_DATA:</b> Register used to pop data out of the ADC FIFO

## 14.21 QEP Interface Registers

There are four QEP Interface Registers:-

- QEP\_0 Registers
- QEP\_1 Registers
- QEP\_2 Registers
- QEP\_3 Registers

QEP Registers	Address Offset	Table
QEP_0	48600000h - 48600024h	Table 13-42
QEP_1	48602000h - 48602024h	Table 13-43
QEP_2	48604000h - 48604024h	Table 13-44
QEP_3	48606000h - 48606024h	Table 13-45

### 14.21.1 QEP\_0 Registers Summary

**Table 14-42. Summary of QEP\_0 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48600000h	4	QEPCON	0000001Ch
48600004h	4	QEFLT	00000000h
48600008h	4	QEPCOUNT	00000000h
4860000Ch	4	QEPMAX	FFFFFFFh
48600010h	4	QEWPDT	00000000h
48600014h	4	QEPCAPDIV	00000000h
48600018h	4	QEPCNTR	00000000h
4860001Ch	4	QEPCAPBUF	00000000h
48600020h	4	QEPIINT_STAT	00000000h
48600024h	4	QEPIINT_MASK	00000000h

#### 14.21.1.1 QEPCON – Offset 48600000h

QEP Control Register. This register controls the QEP operation and provides status flags for the state of the QEP module

Type	Size	Offset	Default
MMIO	32 bit	48600000h	0000001Ch

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	0h RO/V	<b>FIFO_EMPTY:</b> Capture FIFO Empty Status Flag. Set when the FIFO is empty
14:12	0h RW/L	<b>FIFO_THRE:</b> Capture FIFO Threshold. It contains the number of valid data entries in the FIFO: $\text{NUM\_DATA\_ENTRIES} = \text{FIFO\_THRE} + 1$ It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
11	0h RW/L	<b>CAP_MODE:</b> Capture Block Mode. It selects the PhaseA event which triggers the FIFO to store the current QEPCTR value 0 = Single edge 1 = Both edges It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
10:9	0h RW/L	<b>IDX_GATING:</b> Index Gating Select. It selects the state of PhaseA and PhaseB signals at which the index pulse will be gated 00 = PhaseA low and PhaseB low 01 = PhaseA low and PhaseB high 10 = PhaseA high and PhaseB low 11 = PhaseA high and PhaseB high It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
8	0h RW/L	<b>COUNT_RST_MODE:</b> Position Counter Reset Mode 0 = Position counter reset on index event 1 = Position counter reset on maximum position It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
7	0h RO/V	<b>PH_ERR:</b> Phase Error Flag. Set when PhaseA and PhaseB are not quadrature inputs
6	0h RW/L	<b>OP_MODE:</b> Operating Mode 0 = Quadrature Encoder Peripheral (QEP) 1 = Capture Compare (CC) It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/L	<b>SWPAB:</b> Phase A and Phase B Input Swap Select 0 = Phase A and Phase B inputs are not swapped 1 = Phase A and Phase B inputs are swapped It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
4	1h RW/L	<b>EDGE_INDEX:</b> Edge selection of the Index input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
3	1h RW/L	<b>EDGE_B:</b> Edge selection of the PhaseB input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
2	1h RW/L	<b>EDGE_A:</b> Edge selection of the PhaseA input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
1	0h RW/L	<b>FLT_EN:</b> Noise Filters Enable 0 = Filters disabled 1 = Filters enabled It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
0	0h RW	<b>EN:</b> QEP/CC Enable 0 = QEP/CC disabled 1 = QEP/CC enabled

#### 14.21.1.2 QEPFLT — Offset 48600004h

QEP Noise Filter Register

Type	Size	Offset	Default
MMIO	32 bit	48600004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20:0	000000h RW/L	<b>MAX_COUNT:</b> Noise Filter Maximum Count. It selects the maximum glitch width to remove in terms of peripheral clock cycles: $PCLK\_CYCLES = MAX\_COUNT + 2$ It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.1.3 QEPCOUNT — Offset 48600008h

QEP Position Counter Register

Type	Size	Offset	Default
MMIO	32 bit	48600008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>POS_COUNT:</b> Position Count Value. It stores the count value currently reached by the position counter. Disabling the peripheral will automatically clear its content.

#### 14.21.1.4 QEPMAX — Offset 4860000Ch

QEP Maximum Position Register

Type	Size	Offset	Default
MMIO	32 bit	4860000Ch	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFFFh RW/L	<b>MAX_COUNT:</b> Maximum Position Count. It defines the operating range for the position counter. It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.1.5 QEPWDT — Offset 48600010h

QEP Watchdog Timer Register

Type	Size	Offset	Default
MMIO	32 bit	48600010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	<b>TOP:</b> Watchdog Timer Timeout Period. When the WDT reaches this value, a dedicated interrupt is generated to flag a stall event. It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.1.6 QEPCAPDIV — Offset 48600014h

QEP Capture Divider Register

Type	Size	Offset	Default
MMIO	32 bit	48600014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2:0	0h RW/L	<b>CLK_DIV:</b> Clock Divider Value. It allows the clock to be divided as follows: 000 = clock divided by 1 001 = clock divided by 2 010 = clock divided by 4 011 = clock divided by 8 100 = clock divided by 16 101 = clock divided by 32 110 = clock divided by 64 111 = clock divided by 128 It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.1.7 QEPCNTR — Offset 48600018h

QEP Capture Counter Register

Type	Size	Offset	Default
MMIO	32 bit	48600018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>CAP_COUNT:</b> Capture Count Value. It stores the count value currently reached by the free-running capture counter. Disabling the peripheral will automatically clear its content.

#### 14.21.1.8 QEPCAPBUF — Offset 4860001Ch

QEP Capture Data Register

Type	Size	Offset	Default
MMIO	32 bit	4860001Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>DATA:</b> This is the register the processor reads from when retrieving bytes from FIFO

#### 14.21.1.9 QEPINT\_STAT – Offset 48600020h

QEP Raw Interrupt Status Register. Each bit in this register has a corresponding mask bit in the QEPINT\_MASK register. These bits are cleared by writing '1' to the matching interrupt register field.

Type	Size	Offset	Default
MMIO	32 bit	48600020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW/1C/V	<b>FIFOCRIT:</b> Capture Function Event FIFO Critical Interrupt. The number of entries in the 'Capture' FIFO has reached the configured threshold level.
4	0h RW/1C/V	<b>FIFOENTRY:</b> Capture Function Event FIFO Entry Interrupt. An entry has been added to the 'Capture' FIFO.
3	0h RW/1C/V	<b>QEPIR:</b> QEP Function Change Of Direction Detected Interrupt. The Quadrature Decoder has detected that the attached motor (or user dial device) has changed direction.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C/V	<b>QEPRST_UP:</b> QEPCOUNT Reset detect with forward count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
1	0h RW/1C/V	<b>QEPRST_DOWN:</b> QEPCOUNT Reset detect with reverse count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
0	0h RW/1C/V	<b>WDT:</b> Watchdog Timeout Interrupt. The Watchdog Timer value has reached the watchdog comparator value.

#### 14.21.1.10 QEPINT\_MASK — Offset 48600024h

QEP Interrupt Mask Register

Type	Size	Offset	Default
MMIO	32 bit	48600024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW	<b>FIFOCRIT:</b> This bit masks the FIFOCRIT interrupt bit from the QEPINT_STAT register
4	0h RW	<b>FIFOENTRY:</b> This bit masks the FIFOENTRY interrupt bit from the QEPINT_STAT register
3	0h RW	<b>QEPRDIR:</b> This bit masks the QEPRDIR interrupt bit from the QEPINT_STAT register
2	0h RW	<b>QEPRST_UP:</b> This bit masks the QEPRST_UP interrupt bit from the QEPINT_STAT register
1	0h RW	<b>QEPRST_DOWN:</b> This bit masks the QEPRST_DOWN interrupt bit from the QEPINT_STAT register
0	0h RW	<b>WDT:</b> This bit masks the WDT interrupt bit from the QEPINT_STAT register

## 14.21.2 QEP\_1 Registers Summary

**Table 14-43. Summary of QEP\_1 Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48602000h	4	QEPCON	0000001Ch
48602004h	4	QEPFLT	00000000h
48602008h	4	QEPCOUNT	00000000h
4860200Ch	4	QEPMAX	FFFFFFFh
48602010h	4	QEPWDT	00000000h
48602014h	4	QEPCAPDIV	00000000h
48602018h	4	QEPCNTR	00000000h
4860201Ch	4	QEPCAPBUF	00000000h
48602020h	4	QEPINT_STAT	00000000h
48602024h	4	QEPINT_MASK	00000000h

### 14.21.2.1 QEPCON — Offset 48602000h

QEP Control Register. This register controls the QEP operation and provides status flags for the state of the QEP module

Type	Size	Offset	Default
MMIO	32 bit	48602000h	0000001Ch

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	0h RO/V	<b>FIFO_EMPTY:</b> Capture FIFO Empty Status Flag. Set when the FIFO is empty
14:12	0h RW/L	<b>FIFO_THRE:</b> Capture FIFO Threshold. It contains the number of valid data entries in the FIFO: NUM_DATA_ENTRIES = FIFO_THRE + 1 It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
11	0h RW/L	<b>CAP_MODE:</b> Capture Block Mode. It selects the PhaseA event which triggers the FIFO to store the current QEPCNTR value 0 = Single edge 1 = Both edges It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

Bit Range	Default & Access	Field Name (ID): Description
10:9	0h RW/L	<b>IDX_GATING:</b> Index Gating Select. It selects the state of PhaseA and PhaseB signals at which the index pulse will be gated 00 = PhaseA low and PhaseB low 01 = PhaseA low and PhaseB high 10 = PhaseA high and PhaseB low 11 = PhaseA high and PhaseB high It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
8	0h RW/L	<b>COUNT_RST_MODE:</b> Position Counter Reset Mode 0 = Position counter reset on index event 1 = Position counter reset on maximum position It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
7	0h RO/V	<b>PH_ERR:</b> Phase Error Flag. Set when PhaseA and PhaseB are not quadrature inputs
6	0h RW/L	<b>OP_MODE:</b> Operating Mode 0 = Quadrature Encoder Peripheral (QEP) 1 = Capture Compare (CC) It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
5	0h RW/L	<b>SWPAB:</b> Phase A and Phase B Input Swap Select 0 = Phase A and Phase B inputs are not swapped 1 = Phase A and Phase B inputs are swapped It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
4	1h RW/L	<b>EDGE_IDX:</b> Edge selection of the Index input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
3	1h RW/L	<b>EDGE_B:</b> Edge selection of the PhaseB input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/L	<b>EDGE_A:</b> Edge selection of the PhaseA input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
1	0h RW/L	<b>FLT_EN:</b> Noise Filters Enable 0 = Filters disabled 1 = Filters enabled It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
0	0h RW	<b>EN:</b> QEP/CC Enable 0 = QEP/CC disabled 1 = QEP/CC enabled

#### 14.21.2.2 QEPFLT — Offset 48602004h

QEP Noise Filter Register

Type	Size	Offset	Default
MMIO	32 bit	48602004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20:0	000000h RW/L	<b>MAX_COUNT:</b> Noise Filter Maximum Count. It selects the maximum glitch width to remove in terms of peripheral clock cycles: $PCLK\_CYCLES = MAX\_COUNT + 2$ It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.2.3 QEPCOUNT — Offset 48602008h

QEP Position Counter Register

Type	Size	Offset	Default
MMIO	32 bit	48602008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>POS_COUNT:</b> Position Count Value. It stores the count value currently reached by the position counter. Disabling the peripheral will automatically clear its content.

#### 14.21.2.4 QEPMAX – Offset 4860200Ch

QEP Maximum Position Register

Type	Size	Offset	Default
MMIO	32 bit	4860200Ch	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW/L	<b>MAX_COUNT:</b> Maximum Position Count. It defines the operating range for the position counter. It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.2.5 QEPWDT – Offset 48602010h

QEP Watchdog Timer Register

Type	Size	Offset	Default
MMIO	32 bit	48602010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	<b>TOP:</b> Watchdog Timer Timeout Period. When the WDT reaches this value, a dedicated interrupt is generated to flag a stall event. It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.2.6 QEPCAPDIV — Offset 48602014h

QEP Capture Divider Register

Type	Size	Offset	Default
MMIO	32 bit	48602014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2:0	0h RW/L	<b>CLK_DIV:</b> Clock Divider Value. It allows the clock to be divided as follows: 000 = clock divided by 1 001 = clock divided by 2 010 = clock divided by 4 011 = clock divided by 8 100 = clock divided by 16 101 = clock divided by 32 110 = clock divided by 64 111 = clock divided by 128 It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.2.7 QEPCNTR — Offset 48602018h

QEP Capture Counter Register

Type	Size	Offset	Default
MMIO	32 bit	48602018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>CAP_COUNT:</b> Capture Count Value. It stores the count value currently reached by the free-running capture counter. Disabling the peripheral will automatically clear its content.

#### 14.21.2.8 QEPCAPBUF — Offset 4860201Ch

QEP Capture Data Register

Type	Size	Offset	Default
MMIO	32 bit	4860201Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>DATA:</b> This is the register the processor reads from when retrieving bytes from FIFO

#### 14.21.2.9 QEPINT\_STAT — Offset 48602020h

QEP Raw Interrupt Status Register. Each bit in this register has a corresponding mask bit in the QEPINT\_MASK register. These bits are cleared by writing '1' to the matching interrupt register field.

Type	Size	Offset	Default
MMIO	32 bit	48602020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW/1C/V	<b>FIFOCRIT:</b> Capture Function Event FIFO Critical Interrupt. The number of entries in the 'Capture' FIFO has reached the configured threshold level.
4	0h RW/1C/V	<b>FIFOENTRY:</b> Capture Function Event FIFO Entry Interrupt. An entry has been added to the 'Capture' FIFO.
3	0h RW/1C/V	<b>QEPRDIR:</b> QEP Function Change Of Direction Detected Interrupt. The Quadrature Decoder has detected that the attached motor (or user dial device) has changed direction.
2	0h RW/1C/V	<b>QEPRST_UP:</b> QEPCOUNT Reset detect with forward count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
1	0h RW/1C/V	<b>QEPRST_DOWN:</b> QEPCOUNT Reset detect with reverse count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
0	0h RW/1C/V	<b>WDT:</b> Watchdog Timeout Interrupt. The Watchdog Timer value has reached the watchdog comparator value.

#### 14.21.2.10 QEPINT\_MASK – Offset 48602024h

QEP Interrupt Mask Register

Type	Size	Offset	Default
MMIO	32 bit	48602024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW	<b>FIFOCRIT:</b> This bit masks the FIFOCRIT interrupt bit from the QEPINT_STAT register
4	0h RW	<b>FIFOENTRY:</b> This bit masks the FIFOENTRY interrupt bit from the QEPINT_STAT register
3	0h RW	<b>QEPRDIR:</b> This bit masks the QEPRDIR interrupt bit from the QEPINT_STAT register
2	0h RW	<b>QEPRST_UP:</b> This bit masks the QEPRST_UP interrupt bit from the QEPINT_STAT register
1	0h RW	<b>QEPRST_DOWN:</b> This bit masks the QEPRST_DOWN interrupt bit from the QEPINT_STAT register
0	0h RW	<b>WDT:</b> This bit masks the WDT interrupt bit from the QEPINT_STAT register

### 14.21.3 QEP\_2 Registers Summary

Table 14-44. Summary of QEP\_2 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48604000h	4	QEPCON	0000001Ch
48604004h	4	QEFLT	00000000h
48604008h	4	QEPCOUNT	00000000h
4860400Ch	4	QEPMAX	FFFFFFFh
48604010h	4	QEPWDT	00000000h
48604014h	4	QEPCAPDIV	00000000h
48604018h	4	QEPCNTR	00000000h
4860401Ch	4	QEPCAPBUF	00000000h
48604020h	4	QEPINT_STAT	00000000h
48604024h	4	QEPINT_MASK	00000000h

#### 14.21.3.1 QEPCON – Offset 48604000h

QEP Control Register. This register controls the QEP operation and provides status flags for the state of the QEP module

Type	Size	Offset	Default
MMIO	32 bit	48604000h	0000001Ch

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	0h RO/V	<b>FIFO_EMPTY:</b> Capture FIFO Empty Status Flag. Set when the FIFO is empty
14:12	0h RW/L	<b>FIFO_THRE:</b> Capture FIFO Threshold. It contains the number of valid data entries in the FIFO: NUM_DATA_ENTRIES = FIFO_THRE + 1 It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
11	0h RW/L	<b>CAP_MODE:</b> Capture Block Mode. It selects the PhaseA event which triggers the FIFO to store the current QEPCNTR value 0 = Single edge 1 = Both edges It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
10:9	0h RW/L	<b>INDEX_GATING:</b> Index Gating Select. It selects the state of PhaseA and PhaseB signals at which the index pulse will be gated 00 = PhaseA low and PhaseB low 01 = PhaseA low and PhaseB high 10 = PhaseA high and PhaseB low 11 = PhaseA high and PhaseB high It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
8	0h RW/L	<b>COUNT_RST_MODE:</b> Position Counter Reset Mode 0 = Position counter reset on index event 1 = Position counter reset on maximum position It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
7	0h RO/V	<b>PH_ERR:</b> Phase Error Flag. Set when PhaseA and PhaseB are not quadrature inputs
6	0h RW/L	<b>OP_MODE:</b> Operating Mode 0 = Quadrature Encoder Peripheral (QEP) 1 = Capture Compare (CC) It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/L	<b>SWPAB:</b> Phase A and Phase B Input Swap Select 0 = Phase A and Phase B inputs are not swapped 1 = Phase A and Phase B inputs are swapped It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
4	1h RW/L	<b>EDGE_INDX:</b> Edge selection of the Index input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
3	1h RW/L	<b>EDGE_B:</b> Edge selection of the PhaseB input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
2	1h RW/L	<b>EDGE_A:</b> Edge selection of the PhaseA input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
1	0h RW/L	<b>FILT_EN:</b> Noise Filters Enable 0 = Filters disabled 1 = Filters enabled It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
0	0h RW	<b>EN:</b> QEP/CC Enable 0 = QEP/CC disabled 1 = QEP/CC enabled

#### 14.21.3.2 QEPFLT — Offset 48604004h

QEP Noise Filter Register

Type	Size	Offset	Default
MMIO	32 bit	48604004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20:0	000000h RW/L	<b>MAX_COUNT:</b> Noise Filter Maximum Count. It selects the maximum glitch width to remove in terms of peripheral clock cycles: $PCLK\_CYCLES = MAX\_COUNT + 2$ It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

### 14.21.3.3 QEPCOUNT — Offset 48604008h

QEP Position Counter Register

Type	Size	Offset	Default
MMIO	32 bit	48604008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>POS_COUNT:</b> Position Count Value. It stores the count value currently reached by the position counter. Disabling the peripheral will automatically clear its content.

### 14.21.3.4 QEPMAX — Offset 4860400Ch

QEP Maximum Position Register

Type	Size	Offset	Default
MMIO	32 bit	4860400Ch	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFFFh RW/L	<b>MAX_COUNT:</b> Maximum Position Count. It defines the operating range for the position counter. It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.3.5 QEPWDT — Offset 48604010h

QEP Watchdog Timer Register

Type	Size	Offset	Default
MMIO	32 bit	48604010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	<b>TOP:</b> Watchdog Timer Timeout Period. When the WDT reaches this value, a dedicated interrupt is generated to flag a stall event. It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.3.6 QEPCAPDIV — Offset 48604014h

QEP Capture Divider Register

Type	Size	Offset	Default
MMIO	32 bit	48604014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2:0	0h RW/L	<b>CLK_DIV:</b> Clock Divider Value. It allows the clock to be divided as follows: 000 = clock divided by 1 001 = clock divided by 2 010 = clock divided by 4 011 = clock divided by 8 100 = clock divided by 16 101 = clock divided by 32 110 = clock divided by 64 111 = clock divided by 128 It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.3.7 QEPCNTR — Offset 48604018h

QEP Capture Counter Register

Type	Size	Offset	Default
MMIO	32 bit	48604018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>CAP_COUNT:</b> Capture Count Value. It stores the count value currently reached by the free-running capture counter. Disabling the peripheral will automatically clear its content.

#### 14.21.3.8 QEPCAPBUF — Offset 4860401Ch

QEP Capture Data Register

Type	Size	Offset	Default
MMIO	32 bit	4860401Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>DATA:</b> This is the register the processor reads from when retrieving bytes from FIFO

#### 14.21.3.9 QEPINT\_STAT – Offset 48604020h

QEP Raw Interrupt Status Register. Each bit in this register has a corresponding mask bit in the QEPINT\_MASK register. These bits are cleared by writing '1' to the matching interrupt register field.

Type	Size	Offset	Default
MMIO	32 bit	48604020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW/1C/V	<b>FIFOCRIT:</b> Capture Function Event FIFO Critical Interrupt. The number of entries in the 'Capture' FIFO has reached the configured threshold level.
4	0h RW/1C/V	<b>FIFOENTRY:</b> Capture Function Event FIFO Entry Interrupt. An entry has been added to the 'Capture' FIFO.
3	0h RW/1C/V	<b>QEPIR:</b> QEP Function Change Of Direction Detected Interrupt. The Quadrature Decoder has detected that the attached motor (or user dial device) has changed direction.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C/V	<b>QEPRST_UP:</b> QEPCOUNT Reset detect with forward count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
1	0h RW/1C/V	<b>QEPRST_DOWN:</b> QEPCOUNT Reset detect with reverse count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
0	0h RW/1C/V	<b>WDT:</b> Watchdog Timeout Interrupt. The Watchdog Timer value has reached the watchdog comparator value.

#### 14.21.3.10 QEPINT\_MASK — Offset 48604024h

QEP Interrupt Mask Register

Type	Size	Offset	Default
MMIO	32 bit	48604024h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW	<b>FIFOCRIT:</b> This bit masks the FIFOcrit interrupt bit from the QEPINT_STAT register
4	0h RW	<b>FIFOENTRY:</b> This bit masks the FIFOentry interrupt bit from the QEPINT_STAT register
3	0h RW	<b>QEPRDIR:</b> This bit masks the QEPRDIR interrupt bit from the QEPINT_STAT register
2	0h RW	<b>QEPRST_UP:</b> This bit masks the QEPRST_UP interrupt bit from the QEPINT_STAT register
1	0h RW	<b>QEPRST_DOWN:</b> This bit masks the QEPRST_DOWN interrupt bit from the QEPINT_STAT register
0	0h RW	<b>WDT:</b> This bit masks the WDT interrupt bit from the QEPINT_STAT register

## 14.21.4 QEP\_3 Registers Summary

Table 14-45. Summary of QEP\_3 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
48606000h	4	QEPCON	0000001Ch
48606004h	4	QEFLT	00000000h
48606008h	4	QEPCOUNT	00000000h
4860600Ch	4	QEPMAX	FFFFFFFh
48606010h	4	QEPWDT	00000000h
48606014h	4	QEPCAPDIV	00000000h
48606018h	4	QEPCNTR	00000000h
4860601Ch	4	QEPCAPBUF	00000000h
48606020h	4	QEPIINT_STAT	00000000h
48606024h	4	QEPIINT_MASK	00000000h

### 14.21.4.1 QEPCON — Offset 48606000h

QEP Control Register. This register controls the QEP operation and provides status flags for the state of the QEP module

Type	Size	Offset	Default
MMIO	32 bit	48606000h	0000001Ch

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	0h RO/V	<b>FIFO_EMPTY:</b> Capture FIFO Empty Status Flag. Set when the FIFO is empty
14:12	0h RW/L	<b>FIFO_THRE:</b> Capture FIFO Threshold. It contains the number of valid data entries in the FIFO: NUM_DATA_ENTRIES = FIFO_THRE + 1 It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
11	0h RW/L	<b>CAP_MODE:</b> Capture Block Mode. It selects the PhaseA event which triggers the FIFO to store the current QEPCNTR value 0 = Single edge 1 = Both edges It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

Bit Range	Default & Access	Field Name (ID): Description
10:9	0h RW/L	<b>INDEX_GATING:</b> Index Gating Select. It selects the state of PhaseA and PhaseB signals at which the index pulse will be gated 00 = PhaseA low and PhaseB low 01 = PhaseA low and PhaseB high 10 = PhaseA high and PhaseB low 11 = PhaseA high and PhaseB high It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
8	0h RW/L	<b>COUNT_RST_MODE:</b> Position Counter Reset Mode 0 = Position counter reset on index event 1 = Position counter reset on maximum position It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
7	0h RO/V	<b>PH_ERR:</b> Phase Error Flag. Set when PhaseA and PhaseB are not quadrature inputs
6	0h RW/L	<b>OP_MODE:</b> Operating Mode 0 = Quadrature Encoder Peripheral (QEP) 1 = Capture Compare (CC) It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
5	0h RW/L	<b>SWPAB:</b> Phase A and Phase B Input Swap Select 0 = Phase A and Phase B inputs are not swapped 1 = Phase A and Phase B inputs are swapped It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
4	1h RW/L	<b>EDGE_INDX:</b> Edge selection of the Index input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
3	1h RW/L	<b>EDGE_B:</b> Edge selection of the PhaseB input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/L	<b>EDGE_A:</b> Edge selection of the PhaseA input signal 0 = Falling edge 1 = Rising edge It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
1	0h RW/L	<b>FLT_EN:</b> Noise Filters Enable 0 = Filters disabled 1 = Filters enabled It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN
0	0h RW	<b>EN:</b> QEP/CC Enable 0 = QEP/CC disabled 1 = QEP/CC enabled

#### 14.21.4.2 QEPFLT — Offset 48606004h

QEP Noise Filter Register

Type	Size	Offset	Default
MMIO	32 bit	48606004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20:0	000000h RW/L	<b>MAX_COUNT:</b> Noise Filter Maximum Count. It selects the maximum glitch width to remove in terms of peripheral clock cycles: PCLK_CYCLES = MAX_COUNT + 2 It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.4.3 QEPCOUNT — Offset 48606008h

QEP Position Counter Register

Type	Size	Offset	Default
MMIO	32 bit	48606008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>POS_COUNT:</b> Position Count Value. It stores the count value currently reached by the position counter. Disabling the peripheral will automatically clear its content.

#### 14.21.4.4 QEPMAX — Offset 4860600Ch

QEP Maximum Position Register

Type	Size	Offset	Default
MMIO	32 bit	4860600Ch	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFh RW/L	<b>MAX_COUNT:</b> Maximum Position Count. It defines the operating range for the position counter. It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.4.5 QEPWDT — Offset 48606010h

QEP Watchdog Timer Register

Type	Size	Offset	Default
MMIO	32 bit	48606010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW/L	<b>TOP:</b> Watchdog Timer Timeout Period. When the WDT reaches this value, a dedicated interrupt is generated to flag a stall event. It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.4.6 QEPCAPDIV — Offset 48606014h

QEP Capture Divider Register

Type	Size	Offset	Default
MMIO	32 bit	48606014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2:0	0h RW/L	<b>CLK_DIV:</b> Clock Divider Value. It allows the clock to be divided as follows: 000 = clock divided by 1 001 = clock divided by 2 010 = clock divided by 4 011 = clock divided by 8 100 = clock divided by 16 101 = clock divided by 32 110 = clock divided by 64 111 = clock divided by 128 It is writeable by the processor only when the peripheral is disabled. <b>Locked by:</b> QEPCON.EN

#### 14.21.4.7 QEPCNTR — Offset 48606018h

QEP Capture Counter Register

Type	Size	Offset	Default
MMIO	32 bit	48606018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>CAP_COUNT:</b> Capture Count Value. It stores the count value currently reached by the free-running capture counter. Disabling the peripheral will automatically clear its content.

#### 14.21.4.8 QEP\_CAPBUF — Offset 4860601Ch

QEP Capture Data Register

Type	Size	Offset	Default
MMIO	32 bit	4860601Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>DATA:</b> This is the register the processor reads from when retrieving bytes from FIFO

#### 14.21.4.9 QEPINT\_STAT — Offset 48606020h

QEP Raw Interrupt Status Register. Each bit in this register has a corresponding mask bit in the QEPINT\_MASK register. These bits are cleared by writing '1' to the matching interrupt register field.

Type	Size	Offset	Default
MMIO	32 bit	48606020h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW/1C/V	<b>FIFOCRIT:</b> Capture Function Event FIFO Critical Interrupt. The number of entries in the 'Capture' FIFO has reached the configured threshold level.
4	0h RW/1C/V	<b>FIFOENTRY:</b> Capture Function Event FIFO Entry Interrupt. An entry has been added to the 'Capture' FIFO.
3	0h RW/1C/V	<b>QEPRDIR:</b> QEP Function Change Of Direction Detected Interrupt. The Quadrature Decoder has detected that the attached motor (or user dial device) has changed direction.
2	0h RW/1C/V	<b>QEPRST_UP:</b> QEPCOUNT Reset detect with forward count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
1	0h RW/1C/V	<b>QEPRST_DOWN:</b> QEPCOUNT Reset detect with reverse count direction Interrupt; The QEPCOUNT can be reset by one of 2 configurable methods: Index Input detect event or comparator match event
0	0h RW/1C/V	<b>WDT:</b> Watchdog Timeout Interrupt. The Watchdog Timer value has reached the watchdog comparator value.

#### 14.21.4.10 QEPINT\_MASK – Offset 48606024h

QEP Interrupt Mask Register

Type	Size	Offset	Default
MMIO	32 bit	48606024h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW	<b>FIFOCRIT:</b> This bit masks the FIFOENTRY interrupt bit from the QEPINT_STAT register
4	0h RW	<b>FIFOENTRY:</b> This bit masks the FIFOENTRY interrupt bit from the QEPINT_STAT register
3	0h RW	<b>QEPRDIR:</b> This bit masks the QEPRDIR interrupt bit from the QEPINT_STAT register
2	0h RW	<b>QEPRST_UP:</b> This bit masks the QEPRST_UP interrupt bit from the QEPINT_STAT register
1	0h RW	<b>QEPRST_DOWN:</b> This bit masks the QEPRST_DOWN interrupt bit from the QEPINT_STAT register
0	0h RW	<b>WDT:</b> This bit masks the WDT interrupt bit from the QEPINT_STAT register

## 14.22 DMA MISC Registers

There are three DMA MISC registers:-

- DMA\_0 MISC Registers
- DMA\_1 MISC Registers
- DMA\_2 MISC Registers

DMA MISC Registers	Address Offset	Table
DMA_0 MISC	50101000h - 50102000h	Table 13-46
DMA_1 MISC	50105000h - 50106000h	Table 13-47
DMA_2 MISC	50109000h - 5010A000h	Table 13-48

### 14.22.1 DMA\_0 MISC Registers Summary

**Table 14-46. Summary of DMA\_0 MISC Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
50101000h	4	DMA ControlChannel0 (DMA_CTL_CH0)	00000000h
50101004h	4	DMA ControlChannel1 (DMA_CTL_CH1)	00000000h
50101008h	4	DMA ControlChannel2 (DMA_CTL_CH2)	00000000h
5010100Ch	4	DMA ControlChannel3 (DMA_CTL_CH3)	00000000h
50101010h	4	DMA ControlChannel4 (DMA_CTL_CH4)	00000000h
50101014h	4	DMA ControlChannel5 (DMA_CTL_CH5)	00000000h
50101018h	4	DMA ControlChannel6 (DMA_CTL_CH6)	00000000h
5010101Ch	4	DMA ControlChannel7 (DMA_CTL_CH7)	00000000h
50101100h	4	DMA CH0 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH0)	00000000h
50101104h	4	DMA CH1 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH1)	00000000h
50101108h	4	DMA CH2 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH2)	00000000h
5010110Ch	4	DMA CH3 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH3)	00000000h
50101110h	4	DMA CH4 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH4)	00000000h
50101114h	4	DMA CH5 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH5)	00000000h
50101118h	4	DMA CH6 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH6)	00000000h
5010111Ch	4	DMA CH7 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH7)	00000000h
50101200h	4	DMA CH0 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH0)	00000000h
50101204h	4	DMA CH1 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH1)	00000000h
50101208h	4	DMA CH2 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH2)	00000000h
5010120Ch	4	DMA CH3 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH3)	00000000h
50101210h	4	DMA CH4 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH4)	00000000h
50101214h	4	DMA CH5 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH5)	00000000h
50101218h	4	DMA CH6 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH6)	00000000h
5010121Ch	4	DMA CH7 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH7)	00000000h
50101300h	4	DMA Crossbar HW Handshake Interface Select Channel 0 (DMA_XBAR_SEL0)	00000000h
50101304h	4	DMA Crossbar HW Handshake Interface Select Channel 1 (DMA_XBAR_SEL1)	00000000h
50101308h	4	DMA Crossbar HW Handshake Interface Select Channel 2 (DMA_XBAR_SEL2)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
5010130Ch	4	DMA Crossbar HW Handshake Interface Select Channel 3 (DMA_XBAR_SEL3)	00000000h
50101310h	4	DMA Crossbar HW Handshake Interface Select Channel 4 (DMA_XBAR_SEL4)	00000000h
50101314h	4	DMA Crossbar HW Handshake Interface Select Channel 5 (DMA_XBAR_SEL5)	00000000h
50101318h	4	DMA Crossbar HW Handshake Interface Select Channel 6 (DMA_XBAR_SEL6)	00000000h
5010131Ch	4	DMA Crossbar HW Handshake Interface Select Channel 7 (DMA_XBAR_SEL7)	00000000h
50101400h	4	DMA Channel Id Config (DMA_REGACCESS_CHID_CFG)	00000000h
50101404h	4	DMA ECC Error Sresp Error Logging Reg (DMA_ECC_ERR_SRESP)	00000000h
50101410h	4	D0i3 Control (D0I3C)	00000008h
50101414h	4	Clock Gating And Soft Reset (CGSR)	00000000h
50101418h	4	DMA Interrupt Enable (DMA_INT_EN)	00000000h

9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel7 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel7 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel7. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.1.9 DMA CH0 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH0) – Offset 50101100h

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	50101100h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Maddr MSB (ADDR_FILLIN):</b> MSB bits of maddr to drive on IOSF.

#### 14.22.1.10 DMA CH1 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH1) – Offset 50101104h

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

#### 14.22.1.11 DMA CH2 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH2) – Offset 50101108h

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

#### **14.22.1.12 DMA CH3 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH3) – Offset 5010110Ch**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

#### **14.22.1.13 DMA CH4 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH4) – Offset 50101110h**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

#### **14.22.1.14 DMA CH5 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH5) – Offset 50101114h**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

#### **14.22.1.15 DMA CH6 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH6) – Offset 50101118h**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

#### **14.22.1.16 DMA CH7 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH7) – Offset 5010111Ch**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

#### **14.22.1.17 DMA CH0 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH0) – Offset 50101200h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

#### **14.22.1.18 DMA CH1 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH1) – Offset 50101204h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

**14.22.1.19 DMA CH2 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH2)  
— Offset 50101208h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

**14.22.1.20 DMA CH3 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH3)  
— Offset 5010120Ch**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

**14.22.1.21 DMA CH4 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH4)  
— Offset 50101210h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

**14.22.1.22 DMA CH5 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH5)  
— Offset 50101214h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

**14.22.1.23 DMA CH6 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH6)  
— Offset 50101218h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

**14.22.1.24 DMA CH7 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH7)  
— Offset 5010121Ch**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50101100h.

**14.22.1.25 DMA Crossbar HW Handshake Interface Select Channel 0  
(DMA\_XBAR\_SEL0) — Offset 50101300h**

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 0.

Type	Size	Offset	Default
MMIO	32 bit	50101300h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	<b>Reserved</b>
16	0h RW	<b>RX TX Mode (RX_TX):</b> 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	<b>Device ID (DEVID):</b> DeviceId of Peripheral to be selected for HW Handshake.

#### 14.22.1.26 DMA Crossbar HW Handshake Interface Select Channel 1 (DMA\_XBAR\_SEL1) — Offset 50101304h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 1.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50101300h.

#### 14.22.1.27 DMA Crossbar HW Handshake Interface Select Channel 2 (DMA\_XBAR\_SEL2) — Offset 50101308h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 2.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50101300h.

#### 14.22.1.28 DMA Crossbar HW Handshake Interface Select Channel 3 (DMA\_XBAR\_SEL3) — Offset 5010130Ch

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 3.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50101300h.

#### 14.22.1.29 DMA Crossbar HW Handshake Interface Select Channel 4 (DMA\_XBAR\_SEL4) — Offset 50101310h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 4.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50101300h.

#### 14.22.1.30 DMA Crossbar HW Handshake Interface Select Channel 5 (DMA\_XBAR\_SEL5) — Offset 50101314h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 5.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50101300h.

#### 14.22.1.31 DMA Crossbar HW Handshake Interface Select Channel 6 (DMA\_XBAR\_SEL6) — Offset 50101318h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 6.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50101300h.

#### 14.22.1.32 DMA Crossbar HW Handshake Interface Select Channel 7 (DMA\_XBAR\_SEL7) — Offset 5010131Ch

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 7.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50101300h.

#### 14.22.1.33 DMA Channel Id Config (DMA\_REGACCESS\_CHID\_CFG) — Offset 50101400h

This reg is used to program the Mreqinfo fo the DMA channel to be programmed next by FW.

Type	Size	Offset	Default
MMIO	32 bit	50101400h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access

31:3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>CHID_CFG:</b> Register access MREQINFO DMA channel id configuration.

#### 14.22.1.34 DMA ECC Error Sresp Error Logging Reg (DMA\_ECC\_ERR\_SRESP) — Offset 50101404h

Sresp register for SRAM\_base/OCP logic selection at DMA.

Type	Size	Offset	Default
MMIO	32 bit	50101404h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	<b>Reserved</b>
21:1	000000h RW/1C	<b>Peripheral BAR Remap Error Status (PER_BAR_REMAP_ERR):</b> This Error status bit is set on the peripheral BAR remap error and cleared when '1' is written to it. Bit 1-8 of this register indicate BAR remap error for the peripherals I2C0-7, Bits 9-14 indicate for UART0-5, bits 15-18 indicate for SPI0-3, Bits 19-20 indicate for I2S0-1 resp. and Bit 21 indicate for ADC.
0	0h RW/1C	<b>Sresp Error Status Bit (ECC_ERR_SRESP):</b> This Error status bit is set on the Rd/Wr Sresp error on the DMA Rd/Wr ports and cleared when '1' is written to it.

#### 14.22.1.35 D0i3 Control (D0I3C) — Offset 50101410h

This register is will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit: 1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost. 2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit. 3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW. 4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW (Write 1 to clear?). A simple edge detect logic as shown in Figure 1 can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following: 1. The device idle capability parameter (ENABLE\_PCI\_IDLE\_CAP) need to be connected to a soft strap for ISH with a value of 1. 2. The STRAP for the MMIO address (strap\_d0i3\_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap\_d0i3\_valid) bit needs should be appropriately tied. 3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set\_device\_pg\_config\_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	50101410h	00000008h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO	<b>Interrupt Request Capable (IRC):</b> Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	<b>Restore Required (RR):</b> When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	<b>D0i3:</b> SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	<b>Interrupt Required (IR):</b> SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RW/1C	<b>Command In Progress (CIP):</b> HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

#### 14.22.1.36 Clock Gating And Soft Reset (CGSR) – Offset 50101414h

This register is used to Clock gate or soft reset an IP by Host/Remote Host.

Type	Size	Offset	Default
MMIO	32 bit	50101414h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	<b>Reserved</b>
16	0h RW	<b>Clock Gate Enable (CG):</b> Setting this field to 1 clock gates the IP.
15:1	0h RO	<b>Reserved</b>
0	0h RW	<b>Soft Reset (SR):</b> Setting this bit to 1 resets the IP.

#### 14.22.1.37 DMA Interrupt Enable (DMA\_INT\_EN) — Offset 50101418h

This register is used to enable the DMA combined interrupt for VC0/VC1.

Type	Size	Offset	Default
MMIO	32 bit	50101418h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>DMA Combined Interrupt For VC0/1 (DMA_COMB_INT_EN):</b> When set, enables the DMA combined interrupt to be generated on VC1 lines to MSI gen. When reset , enables the DMA Combined interrupt to be generated on VC0 lines to MSI gen.

#### 14.22.1.38 DMA VMM Mask (DMA\_VMM\_MASK) — Offset 50102000h

This register is used to program the VMM Mask for each peripheral.

Type	Size	Offset	Default
MMIO	32 bit	50102000h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20:0	000000h RW	<b>Peripheral VMM Mask (PER_VMM_MASK):</b> When set, enables the VMM Mask for the peripheral. When reset, disables the VMM Mask for the peripheral. Bit 0-7 correspond to I2C0-7, Bits 8-13 correspond to UART0-5, bits 14-17 correspond to SPI0-3, Bits 18-19 correspond to I2S0-1 resp. and Bit 20 corresponds to ADC.

## 14.22.2 DMA\_1 MISC Registers Summary

**Table 14-47. Summary of DMA\_1 MISC Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
50105000h	4	DMA ControlChannel0 (DMA_CTL_CH0)	00000000h
50105004h	4	DMA ControlChannel1 (DMA_CTL_CH1)	00000000h
50105008h	4	DMA ControlChannel2 (DMA_CTL_CH2)	00000000h
5010500Ch	4	DMA ControlChannel3 (DMA_CTL_CH3)	00000000h
50105010h	4	DMA ControlChannel4 (DMA_CTL_CH4)	00000000h
50105014h	4	DMA ControlChannel5 (DMA_CTL_CH5)	00000000h
50105018h	4	DMA ControlChannel6 (DMA_CTL_CH6)	00000000h
5010501Ch	4	DMA ControlChannel7 (DMA_CTL_CH7)	00000000h
50105100h	4	DMA CH0 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH0)	00000000h
50105104h	4	DMA CH1 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH1)	00000000h
50105108h	4	DMA CH2 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH2)	00000000h
5010510Ch	4	DMA CH3 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH3)	00000000h
50105110h	4	DMA CH4 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH4)	00000000h
50105114h	4	DMA CH5 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH5)	00000000h
50105118h	4	DMA CH6 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH6)	00000000h
5010511Ch	4	DMA CH7 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH7)	00000000h
50105200h	4	DMA CH0 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH0)	00000000h
50105204h	4	DMA CH1 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH1)	00000000h
50105208h	4	DMA CH2 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH2)	00000000h
5010520Ch	4	DMA CH3 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH3)	00000000h
50105210h	4	DMA CH4 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH4)	00000000h
50105214h	4	DMA CH5 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH5)	00000000h
50105218h	4	DMA CH6 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH6)	00000000h
5010521Ch	4	DMA CH7 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH7)	00000000h
50105300h	4	DMA Crossbar HW Handshake Interface Select Channel 0 (DMA_XBAR_SEL0)	00000000h
50105304h	4	DMA Crossbar HW Handshake Interface Select Channel 1 (DMA_XBAR_SEL1)	00000000h
50105308h	4	DMA Crossbar HW Handshake Interface Select Channel 2 (DMA_XBAR_SEL2)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
5010530Ch	4	DMA Crossbar HW Handshake Interface Select Channel 3 (DMA_XBAR_SEL3)	00000000h
50105310h	4	DMA Crossbar HW Handshake Interface Select Channel 4 (DMA_XBAR_SEL4)	00000000h
50105314h	4	DMA Crossbar HW Handshake Interface Select Channel 5 (DMA_XBAR_SEL5)	00000000h
50105318h	4	DMA Crossbar HW Handshake Interface Select Channel 6 (DMA_XBAR_SEL6)	00000000h
5010531Ch	4	DMA Crossbar HW Handshake Interface Select Channel 7 (DMA_XBAR_SEL7)	00000000h
50105400h	4	DMA Channel Id Config (DMA_REGACCESS_CHID_CFG)	00000000h
50105404h	4	DMA ECC Error Sresp Error Logging Reg (DMA_ECC_ERR_SRESP)	00000000h
50105410h	4	D0i3 Control (D0I3C)	00000008h
50105414h	4	Clock Gating And Soft Reset (CGSR)	00000000h
50105418h	4	DMA Interrupt Enable (DMA_INT_EN)	00000000h
50106000h	4	DMA VMM Mask (DMA_VMM_MASK)	00000000h

#### 14.22.2.1 DMA ControlChannel0 (DMA\_CTL\_CH0) — Offset 50105000h

DMA Control register channel0.

Type	Size	Offset	Default
MMIO	32 bit	50105000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel0 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel0 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel0. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.2.2 DMA ControlChannel1 (DMA\_CTL\_CH1) — Offset 50105004h

DMA Control register channel1.

Type	Size	Offset	Default
MMIO	32 bit	50105004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VCO transaction on IOSF AXI Write port.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VCO transaction on IOSF AXI Read port.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel1 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel1 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel1. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

### 14.22.2.3 DMA ControlChannel2 (DMA\_CTL\_CH2) – Offset 50105008h

DMA Control register channel2.

Type	Size	Offset	Default
MMIO	32 bit	50105008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel2 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel2 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel2. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.2.4 DMA ControlChannel3 (DMA\_CTL\_CH3) — Offset 5010500Ch

DMA Control register channel3.

Type	Size	Offset	Default
MMIO	32 bit	5010500Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VCO transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VCO transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel3 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel3 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel3. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.2.5 DMA ControlChannel4 (DMA\_CTL\_CH4) — Offset 50105010h

DMA Control register channel4.

Type	Size	Offset	Default
MMIO	32 bit	50105010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel4 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel4 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel4. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.2.6 DMA ControlChannel5 (DMA\_CTL\_CH5) — Offset 50105014h

DMA Control register channel5.

Type	Size	Offset	Default
MMIO	32 bit	50105014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VCO transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VCO transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel5 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel5 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel5. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.2.7 DMA ControlChannel6 (DMA\_CTL\_CH6) — Offset 50105018h

DMA Control register channel6.

Type	Size	Offset	Default
MMIO	32 bit	50105018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel6 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel6 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel6. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.2.8 DMA ControlChannel7 (DMA\_CTL\_CH7) — Offset 5010501Ch

DMA Control register channel7.

Type	Size	Offset	Default
MMIO	32 bit	5010501Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VCO transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VCO transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel7 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel7 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel7. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.2.9 DMA CH0 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH0) – Offset 50105100h

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	50105100h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Maddr MSB (ADDR_FILLIN):</b> MSB bits of maddr to drive on IOSF.

#### 14.22.2.10 DMA CH1 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH1) – Offset 50105104h

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

#### 14.22.2.11 DMA CH2 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH2) – Offset 50105108h

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

#### **14.22.2.12 DMA CH3 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH3) – Offset 5010510Ch**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

#### **14.22.2.13 DMA CH4 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH4) – Offset 50105110h**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

#### **14.22.2.14 DMA CH5 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH5) – Offset 50105114h**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

#### **14.22.2.15 DMA CH6 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH6) – Offset 50105118h**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

#### **14.22.2.16 DMA CH7 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH7) – Offset 5010511Ch**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

#### **14.22.2.17 DMA CH0 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH0) – Offset 50105200h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

#### **14.22.2.18 DMA CH1 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH1) – Offset 50105204h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

**14.22.2.19 DMA CH2 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH2)  
— Offset 50105208h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

**14.22.2.20 DMA CH3 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH3)  
— Offset 5010520Ch**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

**14.22.2.21 DMA CH4 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH4)  
— Offset 50105210h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

**14.22.2.22 DMA CH5 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH5)  
— Offset 50105214h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

**14.22.2.23 DMA CH6 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH6)  
— Offset 50105218h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

**14.22.2.24 DMA CH7 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH7)  
— Offset 5010521Ch**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50105100h.

**14.22.2.25 DMA Crossbar HW Handshake Interface Select Channel 0  
(DMA\_XBAR\_SEL0) — Offset 50105300h**

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 0.

Type	Size	Offset	Default
MMIO	32 bit	50105300h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	<b>Reserved</b>
16	0h RW	<b>RX TX Mode (RX_TX):</b> 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	<b>Device ID (DEVID):</b> DeviceId of Peripheral to be selected for HW Handshake.

#### 14.22.2.26 DMA Crossbar HW Handshake Interface Select Channel 1 (DMA\_XBAR\_SEL1) — Offset 50105304h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 1.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50105300h.

#### 14.22.2.27 DMA Crossbar HW Handshake Interface Select Channel 2 (DMA\_XBAR\_SEL2) — Offset 50105308h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 2.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50105300h.

#### 14.22.2.28 DMA Crossbar HW Handshake Interface Select Channel 3 (DMA\_XBAR\_SEL3) — Offset 5010530Ch

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 3.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50105300h.

#### 14.22.2.29 DMA Crossbar HW Handshake Interface Select Channel 4 (DMA\_XBAR\_SEL4) — Offset 50105310h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 4.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50105300h.

#### 14.22.2.30 DMA Crossbar HW Handshake Interface Select Channel 5 (DMA\_XBAR\_SEL5) — Offset 50105314h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 5.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50105300h.

#### 14.22.2.31 DMA Crossbar HW Handshake Interface Select Channel 6 (DMA\_XBAR\_SEL6) — Offset 50105318h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 6.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50105300h.

#### 14.22.2.32 DMA Crossbar HW Handshake Interface Select Channel 7 (DMA\_XBAR\_SEL7) — Offset 5010531Ch

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 7.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50105300h.

#### 14.22.2.33 DMA Channel Id Config (DMA\_REGACCESS\_CHID\_CFG) — Offset 50105400h

This reg is used to program the Mreqinfo fo the DMA channel to be programmed next by FW.

Type	Size	Offset	Default
MMIO	32 bit	50105400h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>CHID_CFG:</b> Register access MREQINFO DMA channel id configuration.

#### 14.22.2.34 DMA ECC Error Sresp Error Logging Reg (DMA\_ECC\_ERR\_SRESP) — Offset 50105404h

Sresp register for SRAM\_base/OCP logic selection at DMA.

Type	Size	Offset	Default
MMIO	32 bit	50105404h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	<b>Reserved</b>
21:1	000000h RW/1C	<b>Peripheral BAR Remap Error Status (PER_BAR_REMAP_ERR):</b> This Error status bit is set on the peripheral BAR remap error and cleared when '1' is written to it. Bit 1-8 of this register indicate BAR remap error for the peripherals I2C0-7, Bits 9-14 indicate for UART0-5, bits 15-18 indicate for SPI0-3, Bits 19-20 indicate for I2S0-1 resp. and Bit 21 indicate for ADC.
0	0h RW/1C	<b>Sresp Error Status Bit (ECC_ERR_SRESP):</b> This Error status bit is set on the Rd/Wr Sresp error on the DMA Rd/Wr ports and cleared when '1' is written to it.

#### 14.22.2.35 D0i3 Control (D0I3C) — Offset 50105410h

This register is will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit: 1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost. 2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit. 3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW. 4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW (Write 1 to clear?). A simple edge detect logic as shown in Figure 1 can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following: 1. The device idle capability parameter (ENABLE\_PCI\_IDLE\_CAP) need to be connected to a soft strap for ISH with a value of 1. 2. The STRAP for the MMIO address (strap\_d0i3\_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap\_d0i3\_valid) bit needs should be appropriately tied. 3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set\_device\_pg\_config\_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	50105410h	00000008h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO	<b>Interrupt Request Capable (IRC):</b> Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	<b>Restore Required (RR):</b> When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	<b>D0i3:</b> SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	<b>Interrupt Required (IR):</b> SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RW/1C	<b>Command In Progress (CIP):</b> HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

#### 14.22.2.36 Clock Gating And Soft Reset (CGSR) – Offset 50105414h

This register is used to Clock gate or soft reset an IP by Host/Remote Host.

Type	Size	Offset	Default
MMIO	32 bit	50105414h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	<b>Reserved</b>
16	0h RW	<b>Clock Gate Enable (CG):</b> Setting this field to 1 clock gates the IP.
15:1	0h RO	<b>Reserved</b>
0	0h RW	<b>Soft Reset (SR):</b> Setting this bit to 1 resets the IP.

#### 14.22.2.37 DMA Interrupt Enable (DMA\_INT\_EN) — Offset 50105418h

This register is used to enable the DMA combined interrupt for VC0/VC1.

Type	Size	Offset	Default
MMIO	32 bit	50105418h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>DMA Combined Interrupt For VC0/1 (DMA_COMB_INT_EN):</b> When set, enables the DMA combined interrupt to be generated on VC1 lines to MSI gen. When reset , enables the DMA Combined interrupt to be generated on VC0 lines to MSI gen.

#### 14.22.2.38 DMA VMM Mask (DMA\_VMM\_MASK) — Offset 50106000h

This register is used to program the VMM Mask for each peripheral.

Type	Size	Offset	Default
MMIO	32 bit	50106000h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20:0	000000h RW	<b>Peripheral VMM Mask (PER_VMM_MASK):</b> When set, enables the VMM Mask for the peripheral. When reset, disables the VMM Mask for the peripheral. Bit 0-7 correspond to I2C0-7, Bits 8-13 correspond to UART0-5, bits 14-17 correspond to SPI0-3, Bits 18-19 correspond to I2S0-1 resp. and Bit 20 corresponds to ADC.

### 14.22.3 DMA\_2 MISC Registers Summary

**Table 14-48. Summary of DMA\_2 MISC Registers**

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
50109000h	4	DMA ControlChannel0 (DMA_CTL_CH0)	00000000h
50109004h	4	DMA ControlChannel1 (DMA_CTL_CH1)	00000000h
50109008h	4	DMA ControlChannel2 (DMA_CTL_CH2)	00000000h
5010900Ch	4	DMA ControlChannel3 (DMA_CTL_CH3)	00000000h
50109010h	4	DMA ControlChannel4 (DMA_CTL_CH4)	00000000h
50109014h	4	DMA ControlChannel5 (DMA_CTL_CH5)	00000000h
50109018h	4	DMA ControlChannel6 (DMA_CTL_CH6)	00000000h
5010901Ch	4	DMA ControlChannel7 (DMA_CTL_CH7)	00000000h
50109100h	4	DMA CH0 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH0)	00000000h
50109104h	4	DMA CH1 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH1)	00000000h
50109108h	4	DMA CH2 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH2)	00000000h
5010910Ch	4	DMA CH3 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH3)	00000000h
50109110h	4	DMA CH4 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH4)	00000000h
50109114h	4	DMA CH5 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH5)	00000000h
50109118h	4	DMA CH6 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH6)	00000000h
5010911Ch	4	DMA CH7 Read Address Fillin (IOSF_ADDR_FILLIN_DMA_CH7)	00000000h
50109200h	4	DMA CH0 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH0)	00000000h
50109204h	4	DMA CH1 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH1)	00000000h
50109208h	4	DMA CH2 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH2)	00000000h
5010920Ch	4	DMA CH3 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH3)	00000000h
50109210h	4	DMA CH4 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH4)	00000000h
50109214h	4	DMA CH5 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH5)	00000000h
50109218h	4	DMA CH6 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH6)	00000000h
5010921Ch	4	DMA CH7 Write Address Fillin (IOSF_DEST_ADDR_FILLIN_DMA_CH7)	00000000h
50109300h	4	DMA Crossbar HW Handshake Interface Select Channel 0 (DMA_XBAR_SEL0)	00000000h
50109304h	4	DMA Crossbar HW Handshake Interface Select Channel 1 (DMA_XBAR_SEL1)	00000000h
50109308h	4	DMA Crossbar HW Handshake Interface Select Channel 2 (DMA_XBAR_SEL2)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
5010930Ch	4	DMA Crossbar HW Handshake Interface Select Channel 3 (DMA_XBAR_SEL3)	00000000h
50109310h	4	DMA Crossbar HW Handshake Interface Select Channel 4 (DMA_XBAR_SEL4)	00000000h
50109314h	4	DMA Crossbar HW Handshake Interface Select Channel 5 (DMA_XBAR_SEL5)	00000000h
50109318h	4	DMA Crossbar HW Handshake Interface Select Channel 6 (DMA_XBAR_SEL6)	00000000h
5010931Ch	4	DMA Crossbar HW Handshake Interface Select Channel 7 (DMA_XBAR_SEL7)	00000000h
50109400h	4	DMA Channel Id Config (DMA_REGACCESS_CHID_CFG)	00000000h
50109404h	4	DMA ECC Error Sresp Error Logging Reg (DMA_ECC_ERR_SRESP)	00000000h
50109410h	4	D0i3 Control (D0I3C)	00000008h
50109414h	4	Clock Gating And Soft Reset (CGSR)	00000000h
50109418h	4	DMA Interrupt Enable (DMA_INT_EN)	00000000h
5010A000h	4	DMA VMM Mask (DMA_VMM_MASK)	00000000h

### 14.22.3.1 DMA ControlChannel0 (DMA\_CTL\_CH0) — Offset 50109000h

DMA Control register channel0.

Type	Size	Offset	Default
MMIO	32 bit	50109000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel0 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel0 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel0. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.3.2 DMA ControlChannel1 (DMA\_CTL\_CH1) — Offset 50109004h

DMA Control register channel1.

Type	Size	Offset	Default
MMIO	32 bit	50109004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VCO transaction on IOSF AXI Write port.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VCO transaction on IOSF AXI Read port.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel1 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel1 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.

1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel4. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.3.6 DMA ControlChannel5 (DMA\_CTL\_CH5) — Offset 50109014h

DMA Control register channel5.

Type	Size	Offset	Default
MMIO	32 bit	50109014h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VCO transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VCO transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel5 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel5 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel5. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.3.7 DMA ControlChannel6 (DMA\_CTL\_CH6) — Offset 50109018h

DMA Control register channel6.

Type	Size	Offset	Default
MMIO	32 bit	50109018h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VC0 transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VC0 transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel6 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel6 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel6. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.3.8 DMA ControlChannel7 (DMA\_CTL\_CH7) — Offset 5010901Ch

DMA Control register channel7.

Type	Size	Offset	Default
MMIO	32 bit	5010901Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>Vc0/1 Wr (IOSF_WR_VC01):</b> When set, enables VC1 transaction on IOSF AXI Write port. When reset, enables VCO transaction on IOSF AXI Write port. When RT_Disable fuse is active, this bit is internally tied to '0'.
10	0h RW	<b>Vc0/1 Rd (IOSF_RD_VC01):</b> When set, enables VC1 transaction on IOSF AXI Read port. When reset, enables VCO transaction on IOSF AXI Read port. When RT_Disable fuse is active, this bit is internally tied to '0'.
9	0h RW	<b>Write Non Snoop Attribute (WR_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF write port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
8	0h RW	<b>Read Non Snoop Attribute (RD_NON_SNOOP):</b> If asserted indicates the transaction from DMA channel0 on IOSF read port is not required to be snooped This bit comes out as req_ns on IOSF master interface.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>Write Root Space (WR_RS):</b> Root Space attribute for DMA channel7 writes on IOSF. The read value of these bits will be 00 when the DMA is host owned.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	<b>Read Root Space (RD_RS):</b> Root Space attribute for DMA channel7 reads on IOSF. The read value of these bits will be 00 when the DMA is host owned.
2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>DMA Transfer Mode (TRANSFER_MODE):</b> Indicates mode of transfer for DMA channel7. Four modes are possible: 11 - DRAM to DRAM mode (external, read from DRAM and write to DRAM), 10 - DRAM to SRAM (read from DRAM and write to SRAM), 01 - SRAM to DRAM (read from SRAM and write to DRAM), 00 - SRAM to SRAM (internal, read from SRAM and write to SRAM).

#### 14.22.3.9 DMA CH0 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH0) – Offset 50109100h

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

Type	Size	Offset	Default
MMIO	32 bit	50109100h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>Maddr MSB (ADDR_FILLIN):</b> MSB bits of maddr to drive on IOSF.

#### 14.22.3.10 DMA CH1 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH1) – Offset 50109104h

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

#### 14.22.3.11 DMA CH2 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH2) – Offset 50109108h

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

#### **14.22.3.12 DMA CH3 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH3) – Offset 5010910Ch**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

#### **14.22.3.13 DMA CH4 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH4) – Offset 50109110h**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

#### **14.22.3.14 DMA CH5 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH5) – Offset 50109114h**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

#### **14.22.3.15 DMA CH6 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH6) – Offset 50109118h**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

#### **14.22.3.16 DMA CH7 Read Address Fillin (IOSF\_ADDR\_FILLIN\_DMA\_CH7) – Offset 5010911Ch**

This register defines the upper MSB bits of maddr port to drive on the IOSF maddr for reads.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

#### **14.22.3.17 DMA CH0 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH0) – Offset 50109200h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

#### **14.22.3.18 DMA CH1 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH1) – Offset 50109204h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

**14.22.3.19 DMA CH2 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH2)  
— Offset 50109208h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

**14.22.3.20 DMA CH3 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH3)  
— Offset 5010920Ch**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

**14.22.3.21 DMA CH4 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH4)  
— Offset 50109210h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

**14.22.3.22 DMA CH5 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH5)  
— Offset 50109214h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

**14.22.3.23 DMA CH6 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH6)  
— Offset 50109218h**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

**14.22.3.24 DMA CH7 Write Address Fillin (IOSF\_DEST\_ADDR\_FILLIN\_DMA\_CH7)  
— Offset 5010921Ch**

This register defines the upper MSB bits to drive on the IOSF maddr for writes.

**Note:** Bit definitions are the same as IOSF\_ADDR\_FILLIN\_DMA\_CH0, offset 50109100h.

**14.22.3.25 DMA Crossbar HW Handshake Interface Select Channel 0  
(DMA\_XBAR\_SEL0) — Offset 50109300h**

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 0.

Type	Size	Offset	Default
MMIO	32 bit	50109300h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	<b>Reserved</b>
16	0h RW	<b>RX TX Mode (RX_TX):</b> 0 Selects Peripheral RX HW Handshake interface, 1 Selects Peripheral TX HW Handshake interface.
15:0	0000h RW	<b>Device ID (DEVID):</b> DeviceId of Peripheral to be selected for HW Handshake.

#### 14.22.3.26 DMA Crossbar HW Handshake Interface Select Channel 1 (DMA\_XBAR\_SEL1) — Offset 50109304h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 1.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50109300h.

#### 14.22.3.27 DMA Crossbar HW Handshake Interface Select Channel 2 (DMA\_XBAR\_SEL2) — Offset 50109308h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 2.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50109300h.

#### 14.22.3.28 DMA Crossbar HW Handshake Interface Select Channel 3 (DMA\_XBAR\_SEL3) — Offset 5010930Ch

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 3.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50109300h.

#### 14.22.3.29 DMA Crossbar HW Handshake Interface Select Channel 4 (DMA\_XBAR\_SEL4) — Offset 50109310h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 4.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50109300h.

#### 14.22.3.30 DMA Crossbar HW Handshake Interface Select Channel 5 (DMA\_XBAR\_SEL5) — Offset 50109314h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 5.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50109300h.

#### 14.22.3.31 DMA Crossbar HW Handshake Interface Select Channel 6 (DMA\_XBAR\_SEL6) — Offset 50109318h

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 6.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50109300h.

#### 14.22.3.32 DMA Crossbar HW Handshake Interface Select Channel 7 (DMA\_XBAR\_SEL7) — Offset 5010931Ch

This register is used to program the DMA Hardware Handshake crossbar to route the peripheral lines to DMA channel 7.

**Note:** Bit definitions are the same as DMA\_XBAR\_SEL0, offset 50109300h.

#### 14.22.3.33 DMA Channel Id Config (DMA\_REGACCESS\_CHID\_CFG) — Offset 50109400h

This reg is used to program the Mreqinfo fo the DMA channel to be programmed next by FW.

Type	Size	Offset	Default
MMIO	32 bit	50109400h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>CHID_CFG:</b> Register access MREQINFO DMA channel id configuration.

#### 14.22.3.34 DMA ECC Error Sresp Error Logging Reg (DMA\_ECC\_ERR\_SRESP) — Offset 50109404h

Sresp register for SRAM\_base/OCP logic selection at DMA.

Type	Size	Offset	Default
MMIO	32 bit	50109404h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	<b>Reserved</b>
21:1	000000h RW/1C	<b>Peripheral BAR Remap Error Status (PER_BAR_REMAP_ERR):</b> This Error status bit is set on the peripheral BAR remap error and cleared when '1' is written to it. Bit 1-8 of this register indicate BAR remap error for the peripherals I2C0-7, Bits 9-14 indicate for UART0-5, bits 15-18 indicate for SPI0-3, Bits 19-20 indicate for I2S0-1 resp. and Bit 21 indicate for ADC.
0	0h RW/1C	<b>Sresp Error Status Bit (ECC_ERR_SRESP):</b> This Error status bit is set on the Rd/Wr Sresp error on the DMA Rd/Wr ports and cleared when '1' is written to it.

#### 14.22.3.35 D0i3 Control (D0I3C) — Offset 50109410h

This register is will be used for D0i3 SW flow. This will be mapped to a different MMIO address from the other IPC registers. (MMIO and OCP address value are yet to be done) The description below also includes the type of access expected for the ISH FW for each configuration bit: 1. The Restore Required (RR) bit (bit [3]) should be RW for the ISH FW which can determine when to set and/or clear these bits depending on when the ISH FW determines whether restore is required although for ISH restore is never required since the power is never lost. 2. The D0i3 (i3) bit (bit [2]) should be RO for ISH FW as it needs to be written only by host SW. The ISH FW can determine to go to a low power state based on this bit. 3. The Interrupt Required (IR) bit (bit [1]) can be RO register for ISH FW and ISH FW can send an interrupt to Host by writing to the ish2host IPC doorbell register when this bit is set by SW. 4. The Command in Progress (CIP) register bit (bit [0]) is HW set and need to be cleared by ISH FW (Write 1 to clear?). A simple edge detect logic as shown in Figure 1 can be used for the setting of this bit in HW. The CIP register bit will be tied to a RTE entry in the IOAPIC as an interrupt source. Hence ISH FW will get an interrupt when the In addition to the registers, the IOSF2OCP Bridge should be parameterized for the following: 1. The device idle capability parameter (ENABLE\_PCI\_IDLE\_CAP) need to be connected to a soft strap for ISH with a value of 1. 2. The STRAP for the MMIO address (strap\_d0i3\_offset) of D0i3 register (IPC offset address: h6D0) and the d0i3 valid (strap\_d0i3\_valid) bit needs should be appropriately tied. 3. The PCE register is made RO register by setting the appropriate parameter (Bridge top level strap: set\_device\_pg\_config\_type[5:0] is set to all 0s). This registers reset and clock domain will be in the OCP domain.

Type	Size	Offset	Default
MMIO	32 bit	50109410h	00000008h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RO	<b>Interrupt Request Capable (IRC):</b> Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0. For ISH this bit will be tied to 0.
3	1h RW/1C	<b>Restore Required (RR):</b> When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	<b>D0i3:</b> SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	<b>Interrupt Required (IR):</b> SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RW/1C	<b>Command In Progress (CIP):</b> HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit.

#### 14.22.3.36 Clock Gating And Soft Reset (CGSR) – Offset 50109414h

This register is used to Clock gate or soft reset an IP by Host/Remote Host.

Type	Size	Offset	Default
MMIO	32 bit	50109414h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	<b>Reserved</b>
16	0h RW	<b>Clock Gate Enable (CG):</b> Setting this field to 1 clock gates the IP.
15:1	0h RO	<b>Reserved</b>
0	0h RW	<b>Soft Reset (SR):</b> Setting this bit to 1 resets the IP.

### 14.22.3.37 DMA Interrupt Enable (DMA\_INT\_EN) — Offset 50109418h

This register is used to enable the DMA combined interrupt for VC0/VC1.

Type	Size	Offset	Default
MMIO	32 bit	50109418h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	<b>Reserved</b>
0	0h RW	<b>DMA Combined Interrupt For VC0/1 (DMA_COMB_INT_EN):</b> When set, enables the DMA combined interrupt to be generated on VC1 lines to MSI gen. When reset , enables the DMA Combined interrupt to be generated on VC0 lines to MSI gen.

### 14.22.3.38 DMA VMM Mask (DMA\_VMM\_MASK) — Offset 5010A000h

This register is used to program the VMM Mask for each peripheral.

Type	Size	Offset	Default
MMIO	32 bit	5010A000h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20:0	000000h RW	<b>Peripheral VMM Mask (PER_VMM_MASK):</b> When set, enables the VMM Mask for the peripheral. When reset, disables the VMM Mask for the peripheral. Bit 0-7 correspond to I2C0-7, Bits 8-13 correspond to UART0-5, bits 14-17 correspond to SPI0-3, Bits 18-19 correspond to I2S0-1 resp. and Bit 20 corresponds to ADC.

## 14.23 GbE TSN Interface Registers

There are two GbE TSN Interface registers:-

- GbE\_0 TSN Registers
- GbE\_1 TSN Registers

Each of GbE TSN register will consist of GbE TSN MISC registers.

GbE TSN Registers	Address Offset	Table
GbE_0 TSN	50200000h - 502014ECh	Table 13-49
GbE_0 TSN MISC	50210000h - 50210500h	Table 13-50
GbE_1 TSN	50220000h - 502214ECh	Table 13-51
GbE_1 TSN MISC	50230000h - 50230500h	Table 13-52

### 14.23.1 GbE\_0 TSN Registers Summary

Table 14-49. Summary of GbE\_0 TSN Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
50200000h	4	MAC_CONFIGURATION	00000000h
50200004h	4	MAC_EXT_CONFIGURATION	00000000h
50200008h	4	MAC_PACKET_FILTER	00000000h
5020000Ch	4	MAC_WATCHDOG_TIMEOUT	00000000h
50200010h	4	MAC_HASH_TABLE_REG0	00000000h
50200014h	4	MAC_HASH_TABLE_REG1	00000000h
50200050h	4	MAC_VLAN_TAG_CTRL	00000000h
50200054h	4	MAC_VLAN_TAG_DATA	00000000h
50200058h	4	MAC_VLAN_HASH_TABLE	00000000h
50200060h	4	MAC_VLAN_INCL	00000000h
50200064h	4	MAC_INNER_VLAN_INCL	00000000h
50200070h	4	MAC_Q0_TX_FLOW_CTRL	00000000h
50200074h	4	MAC_Q1_TX_FLOW_CTRL	00000000h
50200078h	4	MAC_Q2_TX_FLOW_CTRL	00000000h
5020007Ch	4	MAC_Q3_TX_FLOW_CTRL	00000000h
50200080h	4	MAC_Q4_TX_FLOW_CTRL	00000000h
50200084h	4	MAC_Q5_TX_FLOW_CTRL	00000000h
50200088h	4	MAC_Q6_TX_FLOW_CTRL	00000000h
5020008Ch	4	MAC_Q7_TX_FLOW_CTRL	00000000h
50200090h	4	MAC_RX_FLOW_CTRL	00000000h
50200094h	4	MAC_RXQ_CTRL4	00000000h
50200098h	4	MAC_TXQ_PRTY_MAP0	00000000h
5020009Ch	4	MAC_TXQ_PRTY_MAP1	00000000h
502000A0h	4	MAC_RXQ_CTRL0	00000000h
502000A4h	4	MAC_RXQ_CTRL1	00000000h
502000A8h	4	MAC_RXQ_CTRL2	00000000h
502000ACh	4	MAC_RXQ_CTRL3	00000000h
502000B0h	4	MAC_INTERRUPT_STATUS	00000000h
502000B4h	4	MAC_INTERRUPT_ENABLE	00000000h
502000B8h	4	MAC_RX_TX_STATUS	00000000h

502014E8h	4	DMA_CH7_RXP_ACCEPT_CNT	00000000h
502014ECh	4	DMA_CH7_RX_ERI_CNT	00000000h

### 14.23.1.1 MAC\_CONFIGURATION — Offset 50200000h

The MAC Configuration Register establishes the operating mode of the MAC.

Type	Size	Offset	Default
MMIO	32 bit	50200000h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>ARPEN:</b> ARP Offload Enable When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It forwards the ARP packet to the application and also indicate the events in the RxStatus. When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus. This bit is available only when the Enable IPv4 ARP Offload is selected.
30:28	0h RW	<b>SARC:</b> Source Address Insertion or Replacement Control This field controls the source address insertion or replacement for all transmitted packets. Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits[29:28]: 2'b0x: - The mti_sa_ctrl_i and ati_sa_ctrl_i input signals control the SA field generation. 2'b10: - If Bit 30 is set to 0, the MAC inserts the content of the MAC Address 0 registers in the SA field of all transmitted packets. - If Bit 30 is set to 1 and the Enable MAC Address Register 1 option is selected while configuring the core, the MAC inserts the content of the MAC Address 1 registers in the SA field of all transmitted packets. 2'b11: - If Bit 30 is set to 0, the MAC replaces the content of the MAC Address 0 registers in the SA field of all transmitted packets. - If Bit 30 is set to 1 and the MAC Address Register 1 is enabled, the MAC replaces the content of the MAC Address 1 registers in the SA field of all transmitted packets. Note: - Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.
27	0h RW	<b>IPC:</b> Checksum Offload When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled. The Layer 3 and Layer 4 Packet Filter and Enable Split Header features automatically selects the IPC Full Checksum Offload Engine on the Receive side. When any of these features are enabled, you must set the IPC bit.

Bit Range	Default & Access	Field Name (ID): Description
26:24	0h RW	<b>IPG:</b> Inter-Packet Gap These bits control the minimum IPG between packets during transmission. This range of minimum IPG is valid in full-duplex mode. In the half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered. When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG. The above function (IPG less than 96 bit times) is valid only when EIPGEN bit in MAC_Ext_Configuration register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in MAC_Ext_Configuration register.
23	0h RW	<b>GPSLCE:</b> Giant Packet Size Limit Control Enable When this bit is set, the MAC considers the value in GPSL field in MAC_Ext_Configuration register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit. When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet). The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status.
22	0h RW	<b>S2KP:</b> IEEE 802.3as Support for 2K Packets When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets. When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. For more information about how the setting of this bit and the JE bit impact the Giant packet status, see the Table, Gaint Packet Status based on S2KP and JE Bits. Note: When the JE bit is set, setting this bit has no effect on the giant packet status.
21	0h RW	<b>CST:</b> CRC stripping for Type packets When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. Note: For information about how the settings of the ACS bit and this bit impact the packet length, see the Table, Packet Length based on the CST and ACS Bits.
20	0h RW	<b>ACS:</b> Automatic Pad or CRC Stripping When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field. When this bit is reset, the MAC passes all incoming packets to the application, without any modification. Note: For information about how the settings of CST bit and this bit impact the packet length, see the Table, Packet Length based on the CST and ACS Bit .
19	0h RW	<b>WD:</b> Watchdog Disable When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes. When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes.
18	0h RW	<b>BE:</b> Packet Burst Enable When this bit is set, the MAC allows packet bursting during transmission in the GMII half-duplex mode.
17	0h RW	<b>JD:</b> Jabber Disable When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes. When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	<b>JE:</b> Jumbo Packet Enable When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status.
15	0h RW	<b>PS:</b> Port Select This bit selects the Ethernet line speed. This bit, along with Bit 14, selects the exact line speed. In the 10/100 Mbps-only (always 1) or 1000 Mbps-only (always 0) configurations, this bit is read-only (RO) with appropriate value. In default 10/100/1000 Mbps configurations, this bit is read-write (R/W). The mac_speed_o[1] signal reflects the value of this bit.
14	0h RW	<b>FES:</b> Speed This bit selects the speed mode. The mac_speed_o[0] signal reflects the value of this bit.
13	0h RW	<b>DM:</b> Duplex Mode When this bit is set, the MAC operates in the full-duplex mode in which it can transmit and receive simultaneously. This bit is RO with default value of 1'b1 in the full-duplex-only configurations.
12	0h RW	<b>LM:</b> Loopback Mode When this bit is set, the MAC operates in the loopback mode at GMII or MII. The (G)MII Rx clock input (clk_rx_i) is required for the loopback to work properly. This is because the Tx clock is not internally looped back.
11	0h RW	<b>ECRSFD:</b> Enable Carrier Sense Before Transmission in Full-Duplex Mode When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the full-duplex mode. The MAC starts the transmission only when the CRS signal is low. When this bit is reset, the MAC transmitter ignores the status of the CRS signal.
10	0h RW	<b>DO:</b> Disable Receive Own When this bit is set, the MAC disables the reception of packets when the gmii_txen_o is asserted in the half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY. This bit is not applicable in the full-duplex mode.
9	0h RW	<b>DCRS:</b> Disable Carrier Sense During Transmission When this bit is set, the MAC transmitter ignores the (G)MII CRS signal during packet transmission in the half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission. When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission.
8	0h RW	<b>DR:</b> Disable Retry When this bit is set, the MAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive collision error in the Tx packet status. When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the half-duplex mode.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>BL:</b> Back-Off Limit The back-off limit determines the random integer number (r) of slot time delays (4,096 bit times for 1000/2500 Mbps; 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision. n = retransmission attempt. The random integer r takes the value in the range $0 \leq r < 2^k$ . This bit is applicable only in the half-duplex mode.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>DC:</b> Deferral Check When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode. If the MAC is configured for 1000/2500 Mbps operation, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on GMII or MII. The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted. When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive. This bit is applicable only in the half-duplex mode.
3:2	0h RW	<b>PRELEN:</b> Preamble Length for Transmit packets These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the full-duplex mode.
1	0h RW	<b>TE:</b> Transmitter Enable When this bit is set, the Tx state machine of the MAC is enabled for transmission on the GMII or MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets.
0	0h RW	<b>RE:</b> Receiver Enable When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the GMII or MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the GMII or MII interface.

#### 14.23.1.2 MAC\_EXT\_CONFIGURATION — Offset 50200004h

The MAC Extended Configuration Register establishes the operating mode of the MAC.

Type	Size	Offset	Default
MMIO	32 bit	50200004h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved</b>
30	0h RW	<b>APDIM:</b>
29:25	00h RW	<b>EIPG:</b> Extended Inter-Packet Gap The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits), along with IPG field in MAC_Configuration register, gives the minimum IPG greater than 96 bit times in steps of 8 bit times: {EIPG, IPG} 8'h00 - 104 bit times 8'h01 - 112 bit times 8'h02 - 120 bit times ----- ----- 8'hFF - 2144 bit times

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	<b>EIPGEN:</b> Extended Inter-Packet Gap Enable When this bit is set, the MAC interprets EIPG field and IPG field in MAC_Configuration register together as minimum IPG greater than 96 bit times in steps of 8 bit times. When this bit is reset, the MAC ignores EIPG field and interprets IPG field in MAC_Configuration register as minimum IPG less than or equal to 96 bit times in steps of 8 bit times. Note: The extended Inter-Packet Gap feature must be enabled when operating in Full-Duplex mode only. There might be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-Duplex mode.
23	0h RO	<b>Reserved</b>
22:20	0h RW	<b>HDSMS:</b> Maximum Size for Splitting the Header Data These bits indicate the maximum header size allowed for splitting the header data in the received packet.
19	0h RW	<b>PDC:</b> Packet Duplication Control When this bit is set, the received packet with Multicast/Broadcast Destination address is routed to multiple Receive DMA Channels. The Receive DMA Channels is identified by the DCS field of MAC_Address(#i)_High register corresponding to the MAC Address register that matches the Multicast/Broadcast Destination address in the received packet. The DCS field is interpreted to be a one-hot value, each bit corresponding to the Receive DMA Channel. When this bit is reset, the received packet is routed to single Receive DMA Channel. The Receive DMA Channel is identified by the DCS field of MAC_Address(#i)_High register corresponding to the MAC Address register that matches the Destination address in the received packet. The DCS field is interpreted as a binary value.
18	0h RW	<b>USP:</b> Unicast Slow Protocol Packet Detect When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the MAC_Address0_High and MAC_Address0_Low registers. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02). When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2015, Section 5.
17	0h RW	<b>SPEN:</b> Slow Protocol Detection Enable When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Slow Protocol Sub-Type and Code fields in Rx status. When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets.
16	0h RW	<b>DCRCC:</b> Disable CRC Checking for Received Packets When this bit is set, the MAC receiver does not check the CRC field in the received packets. When this bit is reset, the MAC receiver always checks the CRC field in the received packets.
15:14	0h RO	<b>Reserved</b>
13:0	0000h RW	<b>GPSL:</b> Giant Packet Size Limit If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes. For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. When the Enable Double VLAN Processing option is selected, the MAC adds 8 bytes to the programmed value for double VLAN tagged packets. The value in this field is applicable when the GPSLCE bit is set in MAC_Configuration register.

### 14.23.1.3 MAC\_PACKET\_FILTER — Offset 50200008h

The MAC Packet Filter register contains the filter controls for receiving packets. Some of the controls from this register go to the address check block of the MAC which performs the first level of address filtering. The second level of filtering is performed on the incoming packet based on other controls such as Pass Bad Packets and Pass Control Packets.

Type	Size	Offset	Default
MMIO	32 bit	50200008h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>RA:</b> Receive All When this bit is set, the MAC Receiver module passes all received packets to the application, irrespective of whether they pass the address filter or not. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bit in the Rx Status Word. When this bit is reset, the Receiver module passes only those packets to the application that pass the SA or DA address filter.
30:22	0h RO	<b>Reserved</b>
21	0h RW	<b>DNTU:</b> Drop Non-TCP/UDP over IP Packets When this bit is set, the MAC drops the non-TCP or UDP over IP packets. The MAC forward only those packets that are processed by the Layer 4 filter. When this bit is reset, the MAC forwards all non-TCP or UDP over IP packets.
20	0h RW	<b>IPFE:</b> Layer 3 and Layer 4 Filter Enable When this bit is set, the MAC drops packets that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect. When this bit is reset, the MAC forwards all packets irrespective of the match status of the Layer 3 and Layer 4 fields.
19:17	0h RO	<b>Reserved</b>
16	0h RW	<b>VTFE:</b> VLAN Tag Filter Enable When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag.
15:11	0h RO	<b>Reserved</b>
10	0h RW	<b>HPF:</b> Hash or Perfect Filter When this bit is set, the address filter passes a packet if it matches either the perfect filtering or hash filtering as set by the HMC or HUC bit. When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	<b>SAF:</b> Source Address Filter Enable When this bit is set, the MAC compares the SA field of the received packets with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the packet. When this bit is reset, the MAC forwards the received packet to the application with updated SAF bit of the Rx Status depending on the SA address comparison. Note: According to the IEEE specification, Bit 47 of the SA is reserved. However, in DWC_ether_qos, the MAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA.
8	0h RW	<b>SAIF:</b> SA Inverse Filtering When this bit is set, the Address Check block operates in the inverse filtering mode for SA address comparison. If the SA of a packet matches the values programmed in the SA registers, it is marked as failing the SA Address filter. When this bit is reset, if the SA of a packet does not match the values programmed in the SA registers, it is marked as failing the SA Address filter.
7:6	0h RW	<b>PCF:</b> Pass Control Packets These bits control the forwarding of all control packets (including unicast and multicast Pause packets).
5	0h RW	<b>DBF:</b> Disable Broadcast Packets When this bit is set, the AFM module blocks all incoming broadcast packets. In addition, it overrides all other filter settings. When this bit is reset, the AFM module passes all received broadcast packets.
4	0h RW	<b>PM:</b> Pass All Multicast When this bit is set, it indicates that all received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit.
3	0h RW	<b>DAIF:</b> DA Inverse Filtering When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed.
2	0h RW	<b>HMC:</b> Hash Multicast When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the hash table. When this bit is reset, the MAC performs the perfect destination address filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers.
1	0h RW	<b>HUC:</b> Hash Unicast When this bit is set, the MAC performs the destination address filtering of unicast packets according to the hash table. When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers.
0	0h RW	<b>PR:</b> Promiscuous Mode When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set.

#### 14.23.1.4 MAC\_WATCHDOG\_TIMEOUT – Offset 5020000Ch

The Watchdog Timeout register controls the watchdog timeout for received packets.

Type	Size	Offset	Default
MMIO	32 bit	5020000Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW	<b>PWE:</b> Programmable Watchdog Enable When this bit is set and the WD bit of the MAC_Configuration register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in MAC_Configuration register.
7:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>WTO:</b> Watchdog Timeout When the PWE bit is set and the WD bit of the MAC_Configuration register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet. Note: When the PWE bit is set, the value in this field should be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped.

#### 14.23.1.5 MAC\_HASH\_TABLE\_REG0 – Offset 50200010h

The Hash Table Register 0 contains the first 32 bits of the hash table, when the width of the hash table is 128 or 256 bits. You can specify the width of the hash table by using the Hash Table Size option in coreConsultant. The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5. The hash value of the destination address is calculated in the following way: - Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32). - Perform bitwise reversal for the value obtained in Step 1. - Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2. If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC\_Packet\_Filter, all multicast packets are accepted regardless of the multicast hash values. If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Hash Table Register X registers are written. If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	50200010h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>HT31TO:</b> MAC Hash Table First 32 Bits This field contains the first 32 Bits [31:0] of the Hash table.

#### 14.23.1.6 MAC\_HASH\_TABLE\_REG1 – Offset 50200014h

The Hash Table Register 1 contains the second 32 bits of the hash table. You can specify the width of the hash table by using the Hash Table Size option in coreConsultant. The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5. The hash value of the destination address is calculated in the following way: - Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32). - Perform bitwise reversal for the value obtained in Step 1. - Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2. If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC\_Packet\_Filter, all multicast packets are accepted regardless of the multicast hash values. If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Hash Table Register X registers are written. If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>HT63T32:</b> MAC Hash Table Second 32 Bits This field contains the second 32 Bits [63:32] of the Hash table.

#### 14.23.1.7 MAC\_VLAN\_TAG\_CTRL – Offset 50200050h

This register is the redefined format of the MAC VLAN Tag Register. It is used for indirect addressing. It contains the address offset, command type and Busy Bit for CSR access of the Per VLAN Tag registers.

Type	Size	Offset	Default
MMIO	32 bit	50200050h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>EIVLRXS:</b> Enable Inner VLAN Tag in Rx Status When this bit is set, the MAC provides the inner VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the inner VLAN Tag in Rx status.
30	0h RO	<b>Reserved</b>
29:28	0h RW	<b>EIVLS:</b> Enable Inner VLAN Tag Stripping on Receive This field indicates the stripping operation on inner VLAN Tag in received packet.
27	0h RW	<b>ERIVLT:</b> Enable Inner VLAN Tag Comparison When this bit, VTHM bit and the EDVLP field are set, the MAC receiver enables VLAN Hash filtering operation on the inner VLAN Tag (if present). When this bit is reset and VTHM bit is set, the MAC receiver enables VLAN Hash filtering operation on the outer VLAN Tag (if present). The ERSVLM bit and DOVLTC bit determines which VLAN type is enabled for filtering.
26	0h RW	<b>EDVLP:</b> Enable Double VLAN Processing When this bit is set, the MAC enables processing of up to two VLAN Tags on Tx and Rx (if present). When this bit is reset, the MAC enables processing of up to one VLAN Tag on Tx and Rx (if present).

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	<b>VTHM:</b> VLAN Tag Hash Table Match Enable When this bit is set, the most significant four bits of CRC of VLAN Tag are used to index the content of the MAC_VLAN_Hash_Table register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the packet matched the VLAN hash table. When the ETV bit is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison. When the ETV bit is reset, the CRC of the 16-bit VLAN tag is used for comparison. When this bit is reset, the VLAN Hash Match operation is not performed.
24	0h RW	<b>EVLRXS:</b> Enable VLAN Tag in Rx status When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status.
23	0h RO	<b>Reserved</b>
22:21	0h RW	<b>EVLS:</b> Enable VLAN Tag Stripping on Receive This field indicates the stripping operation on the outer VLAN Tag in received packet.
20	0h RW	<b>DOVLTC:</b> Disable VLAN Type Check for VLAN Hash Filtering When this bit is set, the MAC VLAN Hash Filter does not check whether the VLAN Tag specified by the ERIVLT bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC VLAN Hash Filter filters or matches the VLAN Tag specified by the ERIVLT bit only when VLAN Tag type is similar to the one specified by the ERSVLM bit.
19	0h RW	<b>ERSVLM:</b> Enable Receive S-VLAN Match for VLAN Hash Filtering When this bit is set, the MAC receiver enables VLAN Hash filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables VLAN Hash filtering or matching for C-VLAN (Type = 0x8100) packets. The ERIVLT bit determines the VLAN tag position considered for VLAN Hash filtering or matching.
18	0h RW	<b>ESVL:</b> Enable S-VLAN When this bit is set, the MAC transmitter and receiver consider the S-VLAN packets (Type = 0x88A8) as valid VLAN tagged packets.
17	0h RW	<b>VTIM:</b> VLAN Tag Inverse Match Enable When this bit is set, this bit enables the VLAN Tag inverse matching. The packets without matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The packets with matched VLAN Tag are marked as matched.
16	0h RW	<b>ETV:</b> Enable 12-Bit VLAN Tag Comparison for VLAN Hash Filtering When this bit is set, a 12-bit VLAN identifier is used for VLAN Hash filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag in the received VLAN-tagged packet are used for hash-based VLAN filtering. When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN packet are used for VLAN hash filtering.
15:5	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
4:2	0h RW	<b>OFS:</b> Offset This field holds the address offset of the MAC VLAN Tag Filter Register which the application is trying to access. The width of the field depends on the number of MAC VLAN Tag Registers enabled.
1	0h RW	<b>CT:</b> Command Type This bit indicates if the current register access is a read or a write. When set, it indicate a read operation. When reset, it indicates a write operation.
0	0h RW	<b>OB:</b> Operation Busy This bit is set along with a read or write command for initiating the indirect access to per VLAN Tag Filter register. This bit is reset when the read or write command to per VLAN Tag Filter indirect access register is complete. The next indirect register access can be initiated only after this bit is reset. During a write operation, the bit is reset only after the data has been written into the Per VLAN Tag register. During a read operation, the data should be read from the MAC_VLAN_Tag_Data register only after this bit is reset.

#### 14.23.1.8 MAC\_VLAN\_TAG\_DATA — Offset 50200054h

This register holds the read/write data for Indirect Access of the Per VLAN Tag registers. During the read access, this field contains valid read data only after the OB bit is reset. During the write access, this field should be valid prior to setting the OB bit in the MAC\_VLAN\_Tag\_Ctrl Register.

Type	Size	Offset	Default
MMIO	32 bit	50200054h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved</b>
27:25	0h RW	<b>DMACHN:</b> DMA Channel Number The DMA Channel number to which the VLAN Tagged Frame is to be routed if it passes this VLAN Tag Filter is programmed in this field. If the Routing based on VLAN Tag Filter is not necessary, this field need not be programmed.
24	0h RW	<b>DMACHEN:</b> DMA Channel Number Enable This bit is the Enable for the DMA Channel Number value programmed in the field DMACH. When this bit is reset, the Routing does not occur based on VLAN Filter result. The frame is routed based on DA Based DMA Channel Routing.
23:21	0h RO	<b>Reserved</b>
20	0h RW	<b>ERIVLT:</b> Enable Inner VLAN Tag Comparison This bit is valid only when Double VLAN Tag Enable of the Filter is set. When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present).

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	<b>ERSVLM:</b> Enable S-VLAN Match for received Frames This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets.
18	0h RW	<b>DOVLTC:</b> Disable VLAN Type Comparison This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC does not check whether the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC filters or matches the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit only when VLAN Tag type is similar to the one specified by the Enable S-VLAN Match for received Frames bit.
17	0h RW	<b>ETV:</b> 12bits or 16bits VLAN comparison This bit is valid only when VEN of the Filter is set. When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet.
16	0h RW	<b>VEN:</b> VLAN Tag Enable This bit is used to enable or disable the VLAN Tag. When this bit is set, the MAC compares the VLAN Tag of received packet with the VLAN Tag ID. When this bit is reset, no comparison is performed irrespective of the programming of the other fields.
15:0	0000h RW	<b>VID:</b> VLAN Tag ID This field holds the VLAN Tag value which is used by the MAC for perfect comparison. It is valid when VLAN Tag Enable is set.

#### 14.23.1.9 MAC\_VLAN\_HASH\_TABLE – Offset 50200058h

When VTHM bit of the MAC\_VLAN\_Tag register is set, the 16-bit VLAN Hash Table register is used for group address filtering based on the VLAN tag. For hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on the ETV bit of MAC\_VLAN\_Tag Register) in the incoming packet is passed through the CRC logic. The upper four bits of the calculated hash value are used to index the contents of the VLAN Hash table. For example, hash value of 4b'1000 selects Bit 8 of the VLAN Hash table. The hash value of the destination address is calculated in the following way: - Calculate the 32-bit CRC for the VLAN tag or ID (For steps to calculate CRC32, see Section 3.2.8 of IEEE 802.3). - Perform bitwise reversal for the value obtained in step 1. - Take the upper four bits from the value obtained in step 2. If the VLAN hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[15:8] (in little-endian mode) or Bits[7:0] (in big-endian mode) of this register are written. - If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	<b>BUSY:</b> Busy This bit indicates the status of the read/write operation of indirect access to the queue/channel specific VLAN inclusion register. For write operation write to a register is complete when this bit is reset. For read operation the read data is valid when the bit is reset. The application must make sure that this bit is reset before attempting subsequent access to this register.
30	0h RW	<b>RDWR:</b> Read write control This bit controls the read or write operation for indirectly accessing the queue/channel specific VLAN Inclusion register. When set indicates write operation and when reset indicates read operation. This does not have any effect when CBTI is reset.
29:27	0h RO	<b>Reserved</b>
26:24	0h RW	<b>ADDR:</b> Address This field selects one of the queue/channel specific VLAN Inclusion register for read/write access. This does not have any effect when CBTI is reset.
23:22	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	<b>CBTI:</b> Channel based tag insertion When this bit is set, outer VLAN tag is inserted for every packets transmitted by the MAC. The tag value is taken from the queue/channel specific VLAN tag register. The VLT, VLP, VLC, and VLT fields of this register are ignored when this bit is set. When this bit is set, a write operation to byte 3 of this register initiates the read/write access to the indirect register. When reset, outer VLAN operation is based on the setting of VLT, VLP, VLC and VLT fields of this register.
20	0h RW	<b>VLTI:</b> VLAN Tag Input When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from: - The Tx descriptor
19	0h RW	<b>CSVL:</b> C-VLAN or S-VLAN When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.
18	0h RW	<b>VLP:</b> VLAN Priority Control When this bit is set, the control bits[17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, the mti_vlan_ctrl_i control input is used and bits[17:16] are ignored.
17:16	0h RW	<b>VLC:</b> VLAN Tag Control in Transmit Packets - 2'b00: No VLAN tag deletion, insertion, or replacement - 2'b01: VLAN tag deletion The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted packets with VLAN tags. - 2'b10: VLAN tag insertion The MAC inserts VLT in bytes 15 and 16 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 13 and 14. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag. - 2'b11: VLAN tag replacement The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted packets (Bytes 13 and 14 are 0x8100 or 0x88a8). Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.
15:0	0000h RW	<b>VLT:</b> VLAN Tag for Transmit Packets This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: - Bits[15:13]: User Priority - Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) - Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

#### 14.23.1.11 MAC\_INNER\_VLAN\_INCL – Offset 50200064h

The Inner VLAN Tag Inclusion or Replacement register contains the inner VLAN tag to be inserted or replaced in the Transmit packet. It also contains the inner VLAN tag insertion controls.

Type	Size	Offset	Default

#### 14.23.1.12 MAC\_Q0\_TX\_FLOW\_CTRL — Offset 50200070h

The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC. A Write to a register with the Busy bit set to 1 triggers the Flow Control block to generate a Pause packet. The fields of the control packet are selected as specified in the 802.3x specification, and the Pause Time value from this register is used in the Pause Time field of the control packet. The Busy bit remains set until the control packet is transferred onto the cable. The application must make sure that the Busy bit is cleared before writing to the register. When the PFCE bit in the MAC\_Rx\_Flow\_Ctrl register is enabled, this register controls the generation of Priority Flow Control (PFC) frames with priorities mapped according to PSRQ0 in the MAC\_RxQ\_Ctrl2 register.

Type	Size	Offset	Default
MMIO	32 bit	502000070h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>PT:</b> Pause Time This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15:8	0h RO	<b>Reserved</b>
7	0h RW	<b>DZPQ:</b> Disable Zero-Quanta Pause When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled.
6:4	0h RW	<b>PLT:</b> Pause Low Threshold This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times.
3:2	0h RO	<b>Reserved</b>
1	0h RW	<b>TFE:</b> Transmit Flow Control Enable Full-Duplex Mode: In the full-duplex mode, when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. Half-Duplex Mode: In the half-duplex mode, when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled.
0	0h RW	<b>FCB_BPA:</b> Flow Control Busy or Backpressure Activate This bit initiates a Pause packet in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set. Full-Duplex Mode: In the full-duplex mode, this bit should be read as 1'b0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Half-Duplex Mode: When this bit is set (and TFE bit is set) in the half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. This control register bit is logically ORed with the mti_flowctrl_i input signal for the backpressure function. When the MAC is configured for the full-duplex mode, the BPA is automatically disabled. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

### 14.23.1.13 MAC\_Q1\_TX\_FLOW\_CTRL — Offset 50200074h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC\_RxQ\_Ctrl2/MAC\_RxQ\_Ctrl3 registers.

Type	Size	Offset	Default
MMIO	32 bit	50200074h	00000000h

0	0h RW	<b>FCB_BPA:</b> Flow Control Busy This bit initiates a PFC packet if the TFE bit is set. To initiate a PFC packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When PFC packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

#### 14.23.1.14 MAC\_Q2\_TX\_FLOW\_CTRL — Offset 50200078h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC\_RxQ\_Ctrl2/MAC\_RxQ\_Ctrl3 registers.

**Note:** Bit definitions are the same as MAC\_Q1\_TX\_FLOW\_CTRL, offset 50200074h.

#### 14.23.1.15 MAC\_Q3\_TX\_FLOW\_CTRL — Offset 5020007Ch

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC\_RxQ\_Ctrl2/MAC\_RxQ\_Ctrl3 registers.

**Note:** Bit definitions are the same as MAC\_Q1\_TX\_FLOW\_CTRL, offset 50200074h.

#### 14.23.1.16 MAC\_Q4\_TX\_FLOW\_CTRL — Offset 50200080h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC\_RxQ\_Ctrl2/MAC\_RxQ\_Ctrl3 registers.

**Note:** Bit definitions are the same as MAC\_Q1\_TX\_FLOW\_CTRL, offset 50200074h.

#### 14.23.1.17 MAC\_Q5\_TX\_FLOW\_CTRL — Offset 50200084h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC\_RxQ\_Ctrl2/MAC\_RxQ\_Ctrl3 registers.

**Note:** Bit definitions are the same as MAC\_Q1\_TX\_FLOW\_CTRL, offset 50200074h.

#### 14.23.1.18 MAC\_Q6\_TX\_FLOW\_CTRL — Offset 50200088h

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC\_RxQ\_Ctrl2/MAC\_RxQ\_Ctrl3 registers.

**Note:** Bit definitions are the same as MAC\_Q1\_TX\_FLOW\_CTRL, offset 50200074h.

#### 14.23.1.19 MAC\_Q7\_TX\_FLOW\_CTRL — Offset 5020008Ch

This register controls the generation of PFC Control packets of priorities mapped as per the PSRQi field in the MAC\_RxQ\_Ctrl2/MAC\_RxQ\_Ctrl3 registers.

**Note:** Bit definitions are the same as MAC\_Q1\_TX\_FLOW\_CTRL, offset 50200074h.

#### 14.23.1.20 MAC\_RX\_FLOW\_CTRL — Offset 50200090h

The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet.

Type	Size	Offset	Default
MMIO	32 bit	50200090h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW	<b>PFCE:</b> Priority Based Flow Control Enable When this bit is set, it enables generation and reception of priority-based flow control (PFC) packets. When this bit is reset, it enables generation and reception of 802.3x Pause control packets.
7:2	0h RO	<b>Reserved</b>
1	0h RW	<b>UP:</b> Unicast Pause Packet Detect A pause packet is processed when it has the unique multicast address specified in the IEEE 802.3. When this bit is set, the MAC can also detect Pause packets with unicast address of the station. This unicast address should be as specified in MAC_Address0_High and MAC_Address0_Low. When this bit is reset, the MAC only detects Pause packets with unique multicast address. Note: The MAC does not process a Pause packet if the multicast address is different from the unique multicast address. This is also applicable to the received PFC packet when the Priority Flow Control (PFC) is enabled. The unique multicast address (0x01_80_C2_00_00_01) is as specified in IEEE 802.1 Qbb-2011.
0	0h RW	<b>RFE:</b> Receive Flow Control Enable When this bit is set and the MAC is operating in full-duplex mode, the MAC decodes the received Pause packet and disables its transmitter for a specified (Pause) time. When this bit is reset or the MAC is operating in half-duplex mode, the decode function of the Pause packet is disabled. When PFC is enabled, flow control is enabled for PFC packets. The MAC decodes the received PFC packet and disables the Transmit queue, with matching priorities, for a duration of received Pause time.

#### 14.23.1.21 MAC\_RXQ\_CTRL4 — Offset 50200094h

The Receive Queue Control 4 register controls the routing of unicast and multicast packets that fail the Destination or Source address filter to the Rx queues.

Type	Size	Offset	Default
MMIO	32 bit	50200094h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19:17	0h RW	<b>VFFQ:</b> VLAN Tag Filter Fail Packets Queue This field holds the Rx queue number to which the tagged packets failing the Destination or Source Address filter (and UFFQE/MFFQE not enabled) or failing the VLAN tag filter must be routed to. This field is valid only when the VFFQE bit is set.
16	0h RW	<b>VFFQE:</b> VLAN Tag Filter Fail Packets Queuing Enable When this bit is set, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter, are routed to the Rx Queue Number programmed in the VFFQ. When this bit is reset, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter are routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set.
15:12	0h RO	<b>Reserved</b>
11:9	0h RW	<b>MFFQ:</b> Multicast Address Filter Fail Packets Queue. This field holds the Rx queue number to which the Multicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the MFFQE bit is set.
8	0h RW	<b>MFFQE:</b> Multicast Address Filter Fail Packets Queuing Enable. When this bit is set, the Multicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the MFFQ. When this bit is reset, the Multicast packets which fail the Destination or Source address filter is routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set.
7:4	0h RO	<b>Reserved</b>
3:1	0h RW	<b>UFFQ:</b> Unicast Address Filter Fail Packets Queue. This field holds the Rx queue number to which the Unicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the UFFQE bit is set.
0	0h RW	<b>UFFQE:</b> Unicast Address Filter Fail Packets Queuing Enable. When this bit is set, the Unicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the UFFQ. When this bit is reset, the Unicast packets which fail the Destination or Source address filter is routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set.

#### 14.23.1.22 MAC\_TXQ\_PRTY\_MAP0 – Offset 50200098h

The Transmit Queue Priority Mapping 0 register contains the priority values assigned to Tx Queue 0 through Tx Queue 3.

Type	Size	Offset	Default
MMIO	32 bit	50200098h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	<b>PSTQ3:</b> Priorities Selected in Transmit Queue 3 This bit is similar to the PSTQ0 bit.
23:16	00h RW	<b>PSTQ2:</b> Priorities Selected in Transmit Queue 2 This bit is similar to the PSTQ0 bit.
15:8	00h RW	<b>PSTQ1:</b> Priorities Selected in Transmit Queue 1 This bit is similar to the PSTQ0 bit.
7:0	00h RW	<b>PSTQ0:</b> Priorities Selected in Transmit Queue 0 This field holds the priorities assigned to Tx Queue 0 by the software. This field determines if Tx Queue 0 should be blocked from transmitting specified pause time when a PFC packet is received with priorities matching the priorities programmed in this field. If the content of this field is not mutually exclusive to corresponding fields of other Transmit queues, that is, same priority is mapped to multiple Tx queues, the MAC blocks all queues with matching priority for specified time.

#### 14.23.1.23 MAC\_TXQ\_PRTY\_MAP1 – Offset 5020009Ch

The Transmit Queue Priority Mapping 1 register contains the priority values assigned to Tx Queue 4 through Tx Queue 7.

Type	Size	Offset	Default
MMIO	32 bit	5020009Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	<b>PSTQ7:</b> Priorities Selected in Transmit Queue 7 This bit is similar to the PSTQ4 bit.

Bit Range	Default & Access	Field Name (ID): Description
23:16	00h RW	<b>PSTQ6:</b> Priorities Selected in Transmit Queue 6 This bit is similar to the PSTQ4 bit.
15:8	00h RW	<b>PSTQ5:</b> Priorities Selected in Transmit Queue 5 This bit is similar to the PSTQ4 bit.
7:0	00h RW	<b>PSTQ4:</b> Priorities Selected in Transmit Queue 4 This field holds the priorities assigned to Tx Queue 4 by the software. This field determines if Tx Queue 4 should be blocked from transmitting specified pause time when a PFC packet is received with priorities matching the priorities programmed in this field. If the content of this field is not mutually exclusive to corresponding fields of other Transmit queues, that is, same priority is mapped to multiple Tx queues, the MAC blocks all queues with matching priority for specified time.

#### 14.23.1.24 MAC\_RXQ\_CTRL0 — Offset 502000A0h

The Receive Queue Control 0 register controls the queue management in the MAC Receiver. Note: In multiple Rx queues configuration, all the queues are disabled by default. Enable the Rx queue by programming the corresponding field in this register.

Type	Size	Offset	Default
MMIO	32 bit	502000A0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:14	0h RW	<b>RXQ7EN:</b> Receive Queue 7 Enable This field is similar to the RXQ0EN field.
13:12	0h RW	<b>RXQ6EN:</b> Receive Queue 6 Enable This field is similar to the RXQ0EN field.
11:10	0h RW	<b>RXQ5EN:</b> Receive Queue 5 Enable This field is similar to the RXQ0EN field.
9:8	0h RW	<b>RXQ4EN:</b> Receive Queue 4 Enable This field is similar to the RXQ0EN field.
7:6	0h RW	<b>RXQ3EN:</b> Receive Queue 3 Enable This field is similar to the RXQ0EN field.
5:4	0h RW	<b>RXQ2EN:</b> Receive Queue 2 Enable This field is similar to the RXQ0EN field.
3:2	0h RW	<b>RXQ1EN:</b> Receive Queue 1 Enable This field is similar to the RXQ0EN field.
1:0	0h RW	<b>RXQ0EN:</b> Receive Queue 0 Enable This field indicates whether Rx Queue 0 is enabled for AV or DCB.

### 14.23.1.25 MAC\_RXQ\_CTRL1 — Offset 502000A4h

The Receive Queue Control 1 register controls the routing of multicast, broadcast, AV, DCB, and untagged packets to the Rx queues.

Type	Size	Offset	Default
MMIO	32 bit	502000A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	<b>Reserved</b>
28	0h RW	<b>OMCBCQ:</b>
27	0h RO	<b>Reserved</b>
26:24	0h RW	<b>FPRQ:</b> Frame Preemption Residue Queue This field holds the Rx queue number to which the residual preemption frames must be forwarded. Preemption frames that are tagged and pass the SA/DA/VLAN filtering are routed based on PSRQ and all other frames are treated as residual frames and is routed to the queue number mentioned in this field. The Queue-0 is used as a default queue for express frames, so this field cannot be programmed to a value 0.
23:22	0h RW	<b>TPQC:</b> Tagged PTP over Ethernet Packets Queuing Control. This field controls the routing of the VLAN Tagged PTPoE packets. If DWC_EQOS_AV_ENABLE is selected in the configuration, the following programmable options are allowed. - 2'b00: VLAN Tagged PTPoE packets are routed as generic VLAN Tagged packet (based on PSRQ for only non-AV enabled Rx Queues). - 2'b01: VLAN Tagged PTPoE packets are routed to Rx Queue specified by PTPQ field (That Rx Queue can be enabled for AV or non-AV traffic). - 2'b10: VLAN Tagged PTPoE packets are routed to only AV enabled Rx Queues based on PSRQ. - 2'b11: Reserved If DWC_EQOS_AV_ENABLE is not selected in the configuration, the following programmable options are allowed. - 1'b0: VLAN Tagged PTPoE packets are routed as generic VLAN Tagged packet (based on PSRQ for DCB/Generic enabled Rx Queues). - 1'b1: VLAN Tagged PTPoE packets are routed to Rx Queues specified by PTPQ field.
21	0h RW	<b>TACPQE:</b> Tagged AV Control Packets Queuing Enable. When set, the MAC routes the received Tagged AV Control packets to the Rx queue specified by AVCPQ field. When reset, the MAC routes the received Tagged AV Control packets based on the tag priority matching the PSRQ fields in MAC_RxQ_Ctrl2 and MAC_RxQ_Ctrl3 registers.
20	0h RW	<b>MCBCQEN:</b> Multicast and Broadcast Queue Enable This bit specifies that Multicast or Broadcast packets routing to the Rx Queue is enabled and the Multicast or Broadcast packets must be routed to Rx Queue specified in MCBCQ field.
19	0h RO	<b>Reserved</b>
18:16	0h RW	<b>MCBCQ:</b> Multicast and Broadcast Queue This field specifies the Rx Queue onto which Multicast or Broadcast Packets are routed. Any Rx Queue enabled for Generic/DCB/AV traffic can be used to route the Multicast or Broadcast Packets.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	<b>Reserved</b>
14:12	0h RW	<b>UPQ:</b> Untagged Packet Queue This field indicates the Rx Queue to which Untagged Packets are to be routed. Any Rx Queue enabled for Generic/DCB/AV traffic can be used to route the Untagged Packets.
11	0h RO	<b>Reserved</b>
10:8	0h RW	<b>DCBCPQ:</b> DCB Control Packets Queue This field specifies the Rx queue on which the received DCB control packets are routed. The DCB data packets are routed based on the PSRQ field of the Transmit Flow Control Register of corresponding queue.
7	0h RO	<b>Reserved</b>
6:4	0h RW	<b>PTPQ:</b> PTP Packets Queue This field specifies the Rx queue on which the PTP packets sent over the Ethernet payload (not over IPv4 or IPv6) are routed. When the AV8021ASMEN bit of MAC_Timestamp_Control register is set, only untagged PTP over Ethernet packets are routed on an Rx Queue. If the bit is not set, then based on programming of TPQC field, both tagged and untagged PTPOE packets can be routed to this Rx Queue.
3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>AVCPQ:</b> AV Untagged Control Packets Queue This field specifies the Receive queue on which the received AV tagged and untagged control packets are routed. The AV tagged (when TACPQE bit is set) and untagged control packets are routed to Receive queue specified by this field.

#### 14.23.1.26 MAC\_RXQ\_CTRL2 — Offset 502000A8h

This register controls the routing of tagged packets based on the USP (user Priority) field of the received packets to the RxQueues 0 to 3.

Type	Size	Offset	Default
MMIO	32 bit	502000A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	<b>PSRQ3:</b> Priorities Selected in the Receive Queue 3 This field decides the priorities assigned to Rx Queue 3. All packets with priorities that match the values set in this field are routed to Rx Queue 3. For example, if PSRQ3[6, 3] are set, packets with USP field equal to 3 or 6 are routed to Rx Queue 3. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 3 crosses the flow control threshold settings.
23:16	00h RW	<b>PSRQ2:</b> Priorities Selected in the Receive Queue 2 This field decides the priorities assigned to Rx Queue 2. All packets with priorities that match the values set in this field are routed to Rx Queue 2. For example, if PSRQ2[1, 0] are set, packets with USP field equal to 1 or 0 are routed to Rx Queue 2. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 2 crosses the flow control threshold settings.
15:8	00h RW	<b>PSRQ1:</b> Priorities Selected in the Receive Queue 1 This field decides the priorities assigned to Rx Queue 1. All packets with priorities that match the values set in this field are routed to Rx Queue 1. For example, if PSRQ1[4] is set, packets with USP field equal to 4 are routed to Rx Queue 1. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 1 crosses the flow control threshold settings.
7:0	00h RW	<b>PSRQ0:</b> Priorities Selected in the Receive Queue 0 This field decides the priorities assigned to Rx Queue 0. All packets with priorities that match the values set in this field are routed to Rx Queue 0. For example, if PSRQ0[5] is set, packets with USP field equal to 5 are routed to Rx Queue 0. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 0 crosses the flow control threshold settings.

#### 14.23.1.27 MAC\_RXQ\_CTRL3 — Offset 502000ACh

This register controls the routing of tagged packets based on the USP (user Priority) field of the received packets to the RxQueues 4 to 7.

Type	Size	Offset	Default
MMIO	32 bit	502000ACh	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	<b>PSRQ7:</b> Priorities Selected in the Receive Queue 7 This field decides the priorities assigned to Rx Queue 7. All packets with priorities that match the values set in this field are routed to Rx Queue 7. For example, if PSRQ7[7, 4] are set, packets with USP field equal to 7 or 4 are routed to Rx Queue 7. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 7 crosses the flow control threshold settings.
23:16	00h RW	<b>PSRQ6:</b> Priorities Selected in the Receive Queue 6 This field decides the priorities assigned to Rx Queue 6. All packets with priorities that match the values set in this field are routed to Rx Queue 6. For example, if PSRQ6[5] are set, packets with USP field equal to 5 are routed to Rx Queue 6. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 6 crosses the flow control threshold settings.
15:8	00h RW	<b>PSRQ5:</b> Priorities Selected in the Receive Queue 5 This field decides the priorities assigned to Rx Queue 5. All packets with priorities that match the values set in this field are routed to Rx Queue 5. For example, if PSRQ5[6] is set, packets with USP field equal to 6 are routed to Rx Queue 5. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 5 crosses the flow control threshold settings.
7:0	00h RW	<b>PSRQ4:</b> Priorities Selected in the Receive Queue 4 This field decides the priorities assigned to Rx Queue 4. All packets with priorities that match the values set in this field are routed to Rx Queue 4. For example, if PSRQ4[7:4] is set, packets with USP field equal to 7, 6, 5, or 4 are routed to Rx Queue 4. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 4 crosses the flow control threshold settings.

#### 14.23.1.28 MAC\_INTERRUPT\_STATUS – Offset 502000B0h

The Interrupt Status register contains the status of interrupts.

Type	Size	Offset	Default
MMIO	32 bit	502000B0h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	<b>Reserved</b>
20	0h RO/V	<b>MFRIS:</b> MMC FPE Receive Interrupt Status This bit is set high when an interrupt is generated in the MMC FPE Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option along with FPE support.
19	0h RO/V	<b>MFTIS:</b> MMC FPE Transmit Interrupt Status This bit is set high when an interrupt is generated in the MMC FPE Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option along with FPE support.
18	0h RO/V	<b>MDIOIS:</b> MDIO Interrupt Status This bit indicates an interrupt event after the completion of MDIO operation. To reset this bit, the application has to read this bit/Write 1 to this bit when RCWE bit of MAC_CSR_SW_Ctrl register is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
17	0h RO/V	<b>FPEIS:</b> Frame Preemption Interrupt Status This bit indicates an interrupt event during the operation of Frame Preemption (Bits[19:16] of MAC_FPE_CTRL_STS register is set). To reset this bit, the application must clear the event in MAC_FPE_CTRL_STS that has caused the Interrupt.
16	0h RO	<b>Reserved</b>
15	0h RO/V	<b>GPIIS:</b> GPI Interrupt Status When the GPIO feature is enabled, this bit is set when any active event (LL or LH) occurs on the GPIS field of the MAC_GPIO_Status register and the corresponding GPIE bit is enabled in the MAC_GPIO_Control register. This bit is cleared on reading lane 0 (GPIS) of the MAC_GPIO_Status register.
14	0h RO/V	<b>RXSTSIS:</b> Receive Status Interrupt This bit indicates the status of received packets. This bit is set when the RWT bit is set in the MAC_Rx_Tx_Status register. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register.
13	0h RO/V	<b>TXSTSIS:</b> Transmit Status Interrupt This bit indicates the status of transmitted packets. This bit is set when any of the following bits is set in the MAC_Rx_Tx_Status register: - Excessive Collision (EXCOL) - Late Collision (LCOL) - Excessive Deferral (EXDEF) - Loss of Carrier (LCARR) - No Carrier (NCARR) - Jabber Timeout (TJT) This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO/V	<b>TSIS:</b> Timestamp Interrupt Status If the Timestamp feature is enabled, this bit is set when any of the following conditions is true: - The system time value is equal to or exceeds the value specified in the Target Time High and Low registers. - There is an overflow in the Seconds register. - The Target Time Error occurred, that is, programmed target time already elapsed. If the Auxiliary Snapshot feature is enabled, this bit is set when the auxiliary snapshot trigger is asserted. In configurations other than EQOS_CORE, when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and Mac_TxTimestamp_Status_Seconds registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Timestamp_Status register.
11	0h RO/V	<b>MMCRXIPIS:</b> MMC Receive Checksum Offload Interrupt Status This bit is set high when an interrupt is generated in the MMC Receive Checksum Offload Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) and Enable Receive TCP/IP Checksum Check options.
10	0h RO/V	<b>MMCTXIS:</b> MMC Transmit Interrupt Status This bit is set high when an interrupt is generated in the MMC Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option.
9	0h RO/V	<b>MMCRXIS:</b> MMC Receive Interrupt Status This bit is set high when an interrupt is generated in the MMC Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option.
8	0h RO/V	<b>MMCIS:</b> MMC Interrupt Status This bit is set high when Bit 11, Bit 10, or Bit 9 is set high. This bit is cleared only when all these bits are low. This bit is valid only when you select the Enable MAC Management Counters (MMC) option.
7:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>LPIIS:</b> LPI Interrupt Status When the Energy Efficient Ethernet feature is enabled, this bit is set for any LPI state entry or exit in the MAC Transmitter or Receiver. This bit is cleared when the corresponding interrupt source bit of MAC_LPI_Control_Status register is read (or corresponding interrupt source bit of MAC_LPI_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set).
4	0h RO/V	<b>PMTIS:</b> PMT Interrupt Status This bit is set when a Magic packet or Wake-on-LAN packet is received in the power-down mode (RWKPRCVD and MGKPRCVD bits in MAC_PMT_Control_Status register). This bit is cleared when corresponding interrupt source bit are cleared because of a Read operation to the MAC_PMT_Control_Status register (or corresponding interrupt source bit of MAC_PMT_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). This bit is valid only when you select the Enable Power Management option.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO/V	<b>PHYIS:</b> PHY Interrupt This bit is set when rising edge is detected on the phy_intr_i input. This bit is cleared when this register is read (or this bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set).
2:1	0h RO	<b>Reserved</b>
0	0h RO/V	<b>RGSMIIS:</b> RGMII or SMII Interrupt Status This bit is set because of any change in value of the Link Status of RGMII or SMII interface (LNKSTS bit in MAC_PHYIF_Control_Status register). This bit is cleared when the MAC_PHYIF_Control_Status register is read (or LNKSTS bit of MAC_PHYIF_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). This bit is valid only when you select the optional RGMII or SMII PHY interface.

#### 14.23.1.29 MAC\_INTERRUPT\_ENABLE – Offset 502000B4h

The Interrupt Enable register contains the masks for generating the interrupts.

Type	Size	Offset	Default
MMIO	32 bit	502000B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	<b>Reserved</b>
18	0h RW	<b>MDIOIE:</b> MDIO Interrupt Enable When this bit is set, it enables the assertion of the interrupt when MDIOS field is set in the MAC_Interrupt_Status register.
17	0h RW	<b>FPEIE:</b> Frame Preemption Interrupt Enable When this bit is set, it enables the assertion of the interrupt when FPEIS field is set in the MAC_Interrupt_Status register.
16:15	0h RO	<b>Reserved</b>
14	0h RW	<b>RXSTSIE:</b> Receive Status Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of RXSTSIS bit in the MAC_Interrupt_Status register.
13	0h RW	<b>TXSTSIE:</b> Transmit Status Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of TXSTSIS bit in the MAC_Interrupt_Status register.
12	0h RW	<b>TSIE:</b> Timestamp Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of TSIS bit in MAC_Interrupt_Status register.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RO	<b>Reserved</b>
5	0h RW	<b>LPIIE:</b> LPI Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of LPIIS bit in MAC_Interrupt_Status register.
4	0h RW	<b>PMTIE:</b> PMT Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of PMTIS bit in MAC_Interrupt_Status register.
3	0h RW	<b>PHYIE:</b> PHY Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of PHYIS bit in MAC_Interrupt_Status register.
2:1	0h RO	<b>Reserved</b>
0	0h RW	<b>RGSMIIIE:</b> RGMII or SMII Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of RGSMIIIS bit in MAC_Interrupt_Status register.

#### 14.23.1.30 MAC\_RX\_TX\_STATUS — Offset 502000B8h

The Receive Transmit Status register contains the Receive and Transmit Error status.

Type	Size	Offset	Default
MMIO	32 bit	502000B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RO/V	<b>RWT:</b> Receive Watchdog Timeout This bit is set when a packet with length greater than 2,048 bytes is received (10, 240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the MAC_Configuration register. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
7:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>EXCOL:</b> Excessive Collisions When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the MAC_Configuration register, this bit is set after the first collision and the packet transmission is aborted. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>LCOL:</b> Late Collision When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode; 512 bytes including Preamble and Carrier Extension in GMII mode). This bit is not valid if the Underflow error occurs. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
3	0h RO/V	<b>EXDEF:</b> Excessive Deferral When the DTXSTS bit is set in the MTL_Operation_Mode register and the DC bit is set in the MAC_Configuration register, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000/2500 Mbps mode or when Jumbo packet is enabled). Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
2	0h RO/V	<b>LCARR:</b> Loss of Carrier When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the loss of carrier occurred during packet transmission, that is, the phy_crs_i signal was inactive for one or more transmission clock periods during packet transmission. This bit is valid only for packets transmitted without collision. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
1	0h RO/V	<b>NCARR:</b> No Carrier When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the carrier signal from the PHY is not present at the end of preamble transmission. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
0	0h RO/V	<b>TJT:</b> Transmit Jabber Timeout This bit indicates that the Transmit Jabber Timer expired which happens when the packet size exceeds 2,048 bytes (10,240 bytes when the Jumbo packet is enabled) and JD bit is reset in the MAC_Configuration register. This bit is set when the packet size exceeds 16,383 bytes and the JD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.

#### 14.23.1.31 MAC\_PMT\_CONTROL\_STATUS – Offset 502000C0h

The PMT Control and Status Register.

Type	Size	Offset	Default
MMIO	32 bit	502000C0h	0000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>RWKFLTRST:</b> Remote Wake-Up Packet Filter Register Pointer Reset When this bit is set, the remote wake-up packet filter register pointer is reset to 3'b000. It is automatically cleared after 1 clock cycle. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
30:29	0h RO	<b>Reserved</b>
28:24	00h RO/V	<b>RWKPTR:</b> Remote Wake-up FIFO Pointer This field gives the current value (0 to 7, 15, or 31 when 4, 8, or 16 Remote Wake-up Packet Filters are selected) of the Remote Wake-up Packet Filter register pointer. When the value of this pointer is equal to maximum for the selected number of Remote Wake-up Packet Filters, the contents of the Remote Wake-up Packet Filter Register are transferred to the clk_rx_i domain when a Write occurs to that register.
23:11	0h RO	<b>Reserved</b>
10	0h RW	<b>RWPFE:</b> Remote Wake-up Packet Forwarding Enable When this bit is set along with RWKPKTEN, the MAC receiver drops all received frames until it receives the expected Wake-up frame. All frames after that event including the received wake-up frame are forwarded to application. This bit is then self-cleared on receiving the wake-up packet. The application can also clear this bit before the expected wake-up frame is received. In such cases, the MAC reverts to the default behavior where packets received are forwarded to the application. This bit must only be set when RWKPKTEN is set high and PWRDWN is set low. The setting of this bit has no effect when PWRDWN is set high. Note: If Magic Packet Enable and Wake-Up Frame Enable are both set along with setting of this bit and Magic Packet is received prior to wake-up frame, this bit is self-cleared on receiving Magic Packet, the received Magic packet is dropped, and all frames after received Magic Packet are forwarded to application. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
9	0h RW	<b>GLBLUCAST:</b> Global Unicast When this bit set, any unicast packet filtered by the MAC (DAF) address recognition is detected as a remote wake-up packet.
8:7	0h RO	<b>Reserved</b>
6	0h RO/V	<b>RWKPRCVD:</b> Remote Wake-Up Packet Received When this bit is set, it indicates that the power management event is generated because of the reception of a remote wake-up packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
5	0h RO/V	<b>MGKPRCVD:</b> Magic Packet Received When this bit is set, it indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared when this register is read. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RO	<b>Reserved</b>
2	0h RW	<b>RWPKTEN:</b> Remote Wake-Up Packet Enable When this bit is set, a power management event is generated when the MAC receives a remote wake-up packet.
1	0h RW	<b>MGKPKTEN:</b> Magic Packet Enable When this bit is set, a power management event is generated when the MAC receives a magic packet.
0	0h RW	<b>PWRDWN:</b> Power Down When this bit is set, the MAC receiver drops all received packets until it receives the expected magic packet or remote wake-up packet. This bit is then self-cleared and the power-down mode is disabled. The software can clear this bit before the expected magic packet or remote wake-up packet is received. The packets received by the MAC after this bit is cleared are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Remote Wake-Up Packet Enable bit is set high. Note: You can gate-off the CSR clock during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, the Software cannot clear this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

#### 14.23.1.32 MAC\_RWK\_PACKET\_FILTER – Offset 502000C4h

The Remote Wakeup Filter registers are implemented as 8, 16, or 32 indirect access registers (wkuppkfilter\_reg#i) based on whether 4, 8, or 16 Remote Wakeup Filters are selected in the configuration and accessed by application through MAC\_RWK\_Packet\_Filter register. When the Remote Wakeup Filters are to be programmed, the entire set of wkuppkfilter\_reg registers must be written. The wkuppkfilter\_reg register is programmed by sequentially writing the eight, sixteen or thirty-two register values in MAC\_RWK\_Packet\_Filter register for wkuppkfilter\_reg0, wkuppkfilter\_reg1, ..., wkuppkfilter\_reg31 respectively. The wkuppkfilter\_reg register is read in a similar way. The MAC updates the wkuppkfilter\_reg register current pointer value in RWKPTR field of MAC\_PMT\_Control\_Status register. The Remote Wakeup Filters are arranged in blocks of 4 filters each and each such block have eight 32-bit wide registers, viz. wkuppkfilter\_reg0-7, wkuppkfilter\_reg8-15, wkuppkfilter\_reg16-23 and wkuppkfilter\_reg24-31. The fields of Remote Wakeup Filter are described as follows:

- **Filter i Byte Mask:** The filter i byte mask register defines the bytes of the packet that are examined by filter i (0, 1, 2, 3, .., 15) to determine whether or not a packet is a wake-up packet. - The MSB (31st bit) must be zero. - Bit j[30:0] is the byte mask. - If Bit j (byte number) of the byte mask is set, the CRC block processes the Filter i Offset + j of the incoming packet; otherwise Filter i Offset + j is ignored.
- **Filter i Command:** The 4-bit filter i command controls the filter i operation. - Bit 3 specifies the address type, defining the destination address type of the pattern. When the bit is set, the pattern applies to only multicast packets; when the bit is reset, the pattern applies only to unicast packet. - Bit 2 (Inverse Mode), when set, reverses the logic of the CRC16 hash function signal, to reject a packet with matching CRC-16 value. Bit 2, along with Bit 1, allows a MAC to reject a subset of remote wake-up packets by creating filter logic such as "Pattern 1 AND NOT Pattern 2". - Bit 1 (And\_Previous) implements the Boolean logic. When set, the result of the current entry is logically ANDed with the result of the previous filter. This AND logic allows a filter pattern longer than 32 bytes by splitting the mask among two, three, or four filters. This depends on the number of filters that have the And\_Previous bit set. The details are provided below:
  - The And\_Previous bit setting is applicable within a set of 4 filters.
  - Setting of And\_Previous bit of filter that is not enabled has no effect, that is setting And\_Previous bit of lowest number filter in the set of 4 filters has no effect. For example, setting of And\_Previous bit of Filter 0 has no effect.
  - If And\_Previous bit is set for filter to form AND chained filter, the AND chain breaks at the point any filter is

not enabled. For example: If Filter 2 And\_Previou bit is set (bit 1 in Filter 2 command is set) but Filter 1 is not enabled (bit 0 in Filter 1 command is reset), then only Filter 2 result is considered. If Filter 2 And\_Previou bit is set (bit 1 in Filter 2 command is set), Filter 3 And\_Previou bit is set (bit 1 in Filter 3 command is set), but Filter 1 is not enabled (bit 0 in Filter 1 command is reset), then only Filter 2 result ANDed with Filter 3 result is considered. If Filter 2 And\_Previou bit is set (bit 1 in Filter 2 command is set), Filter 3 And\_Previou bit is set (bit 1 in Filter 3 command is set), but Filter 2 is not enabled (bit 0 in Filter 2 command is reset), then since setting of Filter 2 And\_Previou bit has no effect only Filter 1 result ORed with Filter 3 result is considered. -- If filters chained by And\_Previou bit setting have complementary programming, then a frame might never pass the AND chained filter. For example, if Filter 2 And\_Previou bit is set (bit 1 in Filter 2 command is set), Filter 1 Address\_Type bit is set (bit 3 in Filter 1 command is set) indicating multicast detection and Filter 2 Address\_Type bit is reset (bit 3 in Filter 2 command is reset) indicating unicast detection or vice versa, a remote wakeup frame does not pass the AND chained filter as a remote wakeup frame cannot be of both unicast and multicast address type. - Bit 0 is the enable for filter i. If Bit 0 is not set, filter i is disabled. Filter i Offset: The filter i offset register defines the offset (within the packet) from which the filter i examines the packets. - This 8-bit pattern-offset is the offset for the filter i first byte to be examined. - The minimum allowed offset is 12, which refers to the 13th byte of the packet. - The offset value 0 refers to the first byte of the packet. Filter i CRC-16: The filter i CRC-16 register contains the CRC-16 value calculated from the pattern and the byte mask programmed in the Remote Wakeup filter register. - The 16-bit CRC calculation uses the following polynomial:  $G(x) = x^{16} + x^{15} + x^2 + 1$  - Each mask, used in the hash function calculation, is compared with a 16-bit value associated with that mask. Each filter has the following: -- 32-bit Mask: Each bit in this mask corresponds to one byte in the detected packet. If the bit is 1, the corresponding byte is taken into the CRC-16 calculation. -- 8-bit Offset Pointer: Specifies the byte to start the CRC-16 computation. The pointer and the mask are used together to locate the bytes to be used in the CRC-16 calculations.

Type	Size	Offset	Default
MMIO	32 bit	502000C4h	00000000h

#### Register Level Access:

BIOS Access	SMM Access	OS Access

### 14.23.1.33 MAC\_LPI\_CONTROL\_STATUS – Offset 502000D0h

The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read.

Type	Size	Offset	Default
MMIO	32 bit	502000D0h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	<b>Reserved</b>
21	0h RW	<b>LPITCSE:</b> LPI Tx Clock Stop Enable When this bit is set, the MAC asserts <code>sbd_tx_clk_gating_ctrl_o</code> signal high after it enters Tx LPI mode to indicate that the Tx clock to MAC can be stopped. When this bit is reset, the MAC does not assert <code>sbd_tx_clk_gating_ctrl_o</code> signal high after it enters Tx LPI mode. If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern. The Tx Clock cannot be gated and so the LPITCSE bit cannot be programmed.
20	0h RW	<b>LPIATE:</b> LPI Timer Enable This bit controls the automatic entry of the MAC Transmitter into and exit out of the LPI state. When LPIATE, LPITXA and LPIEN bits are set, the MAC Transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the MAC_LPI_Entry_Timer register. After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the Transmitter exits LPI state but does not clear LPIEN bit. This enables the re-entry into LPI state when it is IDLE again. When LPIATE is 0, the LPI Auto timer is disabled and MAC Transmitter enters LPI state based on the settings of LPITXA and LPIEN bit descriptions.
19	0h RW	<b>LPITXA:</b> LPI Tx Automate This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side. This bit is not functional in the EQOS-CORE configurations in which the Tx clock gating is done during the LPI mode. If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of MTL_TxQ0_Operation_Mode register, when the MAC is in the LPI mode, it exits the LPI mode. When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode.
18	0h RW	<b>PLSEN:</b> PHY Link Status Enable This bit enables the link status received on the RGMII, SGMII, or SMII Receive paths to be used for activating the LPI LS TIMER. When this bit is set, the MAC uses the link-status bits of the MAC_PHYIF_Control_Status register and the PLS bit for the LPI LS Timer trigger. When this bit is reset, the MAC ignores the link-status bits of the MAC_PHYIF_Control_Status register and takes only the PLS bit.
17	0h RW	<b>PLS:</b> PHY Link Status This bit indicates the link status of the PHY. The MAC Transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER. When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down.
16	0h RW	<b>LPIEN:</b> LPI Enable When this bit is set, it instructs the MAC Transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission. This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission.

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	<b>Reserved</b>
9	0h RO/V	<b>RLPIST:</b> Receive LPI State When this bit is set, it indicates that the MAC is receiving the LPI pattern on the GMII or MII interface.
8	0h RO/V	<b>TLPIST:</b> Transmit LPI State When this bit is set, it indicates that the MAC is transmitting the LPI pattern on the GMII or MII interface.
7:4	0h RO	<b>Reserved</b>
3	0h RO/V	<b>RLPIEX:</b> Receive LPI Exit When this bit is set, it indicates that the MAC Receiver has stopped receiving the LPI pattern on the GMII or MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Note: This bit might not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.
2	0h RO/V	<b>RLPIEN:</b> Receive LPI Entry When this bit is set, it indicates that the MAC Receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Note: This bit might not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.
1	0h RO/V	<b>TLPTEX:</b> Transmit LPI Exit When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPien bit and the LPI TW Timer has expired. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set).
0	0h RO/V	<b>TLPIEN:</b> Transmit LPI Entry When this bit is set, it indicates that the MAC Transmitter has entered the LPI state because of the setting of the LPien bit. This bit is cleared by a read into this register (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set).

#### 14.23.1.34 MAC\_LPI\_TIMERS\_CONTROL — Offset 502000D4h

The LPI Timers Control register controls the timeout values in the LPI states. It specifies the time for which the MAC transmits the LPI pattern and also the time for which the MAC waits before resuming the normal transmission.

Type	Size	Offset	Default
MMIO	32 bit	502000D4h	03E80000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	<b>Reserved</b>
25:16	3E8h RW	<b>LST:</b> LPI LS Timer This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.
15:0	0000h RW	<b>TWT:</b> LPI TW Timer This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

#### 14.23.1.35 MAC\_LPI\_ENTRY\_TIMER – Offset 502000D8h

This register controls the Tx LPI entry timer. This counter is enabled only when bit[20](LPITE) bit of MAC\_LPI\_Control\_Status is set to 1.

Type	Size	Offset	Default
MMIO	32 bit	502000D8h	00000000h

Register Level Access:

27	1h RO/V	<b>TBSSEL:</b> Time Based Scheduling Enable This bit is set to 1 when the Time Based Scheduling feature is selected.
26	1h RO/V	<b>FPESEL:</b> Frame Preemption Enable This bit is set to 1 when the Enable Frame preemption feature is selected.
25:22	0h RO	<b>Reserved</b>
21:20	3h RO/V	<b>ESTWID:</b> Width of the Time Interval field in the Gate Control List This field indicates the width of the Configured Time Interval Field
19:17	4h RO/V	<b>ESTDEP:</b> Depth of the Gate Control List This field indicates the depth of Gate Control list expressed as Log2(DWC_EQOS_EST_DEP)-5

Bit Range	Default & Access	Field Name (ID): Description
16	1h RO/V	<b>ESTSEL:</b> Enhancements to Scheduling Traffic Enable This bit is set to 1 when the Enable Enhancements to Scheduling Traffic feature is selected.
15	0h RO	<b>Reserved</b>
14:13	2h RO/V	<b>FRPES:</b> Flexible Receive Parser Table Entries size This field indicates the Max Number of Parser Entries supported by Flexible Receive Parser.
12:11	2h RO/V	<b>FRPBS:</b> Flexible Receive Parser Buffer size This field indicates the supported Max Number of bytes of the packet data to be Parsed by Flexible Receive Parser.
10	1h RO/V	<b>FRPSEL:</b> Flexible Receive Parser Selected This bit is set to 1 when the Enable Flexible Programmable Receive Parser option is selected.
9	1h RO/V	<b>PDUPSEL:</b> Broadcast/Multicast Packet Duplication This bit is set to 1 when the Broadcast/Multicast Packet Duplication feature is selected.
8:6	0h RO	<b>Reserved</b>
5	1h RO/V	<b>DVLAN:</b> Double VLAN Tag Processing Selected This bit is set to 1 when the Enable Double VLAN Processing Feature is selected.
4	1h RO/V	<b>CBTISEL:</b> Queue/Channel based VLAN tag insertion on Tx Enable This bit is set to 1 when the Enable Queue/Channel based VLAN tag insertion on Tx Feature is selected.
3	0h RO	<b>Reserved</b>
2:0	2h RO/V	<b>NRVF:</b> Number of Extended VLAN Tag Filters Enabled This field indicates the Number of Extended VLAN Tag Filters selected.

#### 14.23.1.44 MAC\_DPP\_FSM\_INTERRUPT\_STATUS – Offset 50200140h

This register contains the status of Automotive Safety related Data Path Parity Errors, Interface Timeout Errors, FSM State Parity Errors and FSM State Timeout Errors. All the non-Reserved bits are cleared on read.

Type	Size	Offset	Default
MMIO	32 bit	50200140h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	<b>Reserved</b>
24	0h RW	<b>FSMPES:</b> FSM State Parity Error Status This field when set indicates one of the FSMs State registers has a parity error detected.
23:18	0h RO	<b>Reserved</b>
17	0h RW	<b>SLVTES:</b> Slave Read/Write Timeout Error Status This field when set indicates that an Application/CSR Timeout has occurred on the AXI slave interface.
16	0h RW	<b>MSTTES:</b> Master Read/Write Timeout Error Status This field when set indicates that an Application/CSR Timeout has occurred on the master (AXI/AHB/ARI/ATI) interface.
15:13	0h RO	<b>Reserved</b>
12	0h RW	<b>PTES:</b> PTP FSM Timeout Error Status This field when set indicates that one of the PTP FSM Timeout has occurred.
11	0h RW	<b>ATES:</b> APP FSM Timeout Error Status This field when set indicates that one of the APP FSM Timeout has occurred.
10	0h RW	<b>CTES:</b> CSR FSM Timeout Error Status This field when set indicates that one of the CSR FSM Timeout has occurred.
9	0h RW	<b>RTES:</b> Rx FSM Timeout Error Status This field when set indicates that one of the Rx FSM Timeout has occurred.
8	0h RW	<b>TTES:</b> Tx FSM Timeout Error Status This field when set indicates that one of the Tx FSM Timeout has occurred.
7:6	0h RO	<b>Reserved</b>
5	0h RW	<b>ARPES:</b> Application Receive interface data path Parity Error Status This bit when set indicates that a parity error is detected at following checkers based on the system configuration as described below - In MTL configuration (DWC_EQOS_SYS=1), parity checker (PC6 as shown in Receive Data path Parity protection diagram) at ARI interface. - In DMA configuration (DWC_EQOS_SYS=2), parity checker (PC6 as shown in Receive Data path Parity protection diagram) at DMA application interface. - In AHB configuration (DWC_EQOS_SYS=3), parity checker (PC6 as shown in Receive Data path Parity protection diagram) at AHB master interface. - In AXI configuration (DWC_EQOS_SYS=4), parity checker (PC6 as shown in Receive Data path Parity protection diagram) at AXI master interface.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>MTSPES:</b> MTL TX Status data path Parity checker Error Status This filed when set indicates that, parity error is detected on the MTL TX Status data on ati interface (or at PC5 as shown in Transmit data path parity protection diagram).
3	0h RW	<b>MPES:</b> MTL data path Parity checker Error Status This bit when set indicates that a parity error is detected at the MTL transmit write controller parity checker (or at PC4 as shown in Transmit data path parity protection diagram).
2	0h RW	<b>RDPES:</b> Read Descriptor Parity checker Error Status This bit when set indicates that a parity error is detected at the DMA Read descriptor parity checker (or at PC3 as shown in Transmit data path parity protection diagram).
1	0h RW	<b>TPES:</b> TSO data path Parity checker Error Status This bit when set indicates that a parity error is detected at the DMA TSO parity checker (or at PC2 as shown in Transmit data path parity protection diagram).
0	0h RO	<b>Reserved</b>

#### 14.23.1.45 MAC\_FSM\_CONTROL – Offset 50200148h

This register is used to control the FSM State parity and timeout error injection in Debug mode.

Type	Size	Offset	Default
MMIO	32 bit	50200148h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	<b>Reserved</b>
28	0h RW	<b>PLGRNML:</b> PTP Large/Normal Mode Select This field when set indicates that large mode tic generation is used for PTP domain, else normal mode tic generation is used.
27	0h RW	<b>ALGRNML:</b> APP Large/Normal Mode Select This field when set indicates that large mode tic generation is used for APP domain, else normal mode tic generation is used.
26	0h RW	<b>CLGRNML:</b> CSR Large/Normal Mode Select This field when set indicates that large mode tic generation is used for CSR domain, else normal mode tic generation is used.
25	0h RW	<b>RLGRNML:</b> Rx Large/Normal Mode Select This field when set indicates that large mode tic generation is used for Rx domain, else normal mode tic generation is used.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	<b>TLGRNML:</b> Tx Large/Normal Mode Select This field when set indicates that large mode tic generation is used for Tx domain, else normal mode tic generation is used.
23:21	0h RO	<b>Reserved</b>
20	0h RW	<b>PPEIN:</b> PTP FSM Parity Error Injection This field when set indicates that Error Injection for PTP FSM Parity is enabled.
19	0h RW	<b>APEIN:</b> APP FSM Parity Error Injection This field when set indicates that Error Injection for APP FSM Parity is enabled.
18	0h RW	<b>CPEIN:</b> CSR FSM Parity Error Injection This field when set indicates that Error Injection for CSR Parity is enabled.
17	0h RW	<b>RPEIN:</b> Rx FSM Parity Error Injection This field when set indicates that Error Injection for RX FSM Parity is enabled.
16	0h RW	<b>TPEIN:</b> Tx FSM Parity Error Injection This field when set indicates that Error Injection for TX FSM Parity is enabled.
15:13	0h RO	<b>Reserved</b>
12	0h RW	<b>PTEIN:</b> PTP FSM Timeout Error Injection This field when set indicates that Error Injection for PTP FSM timeout is enabled.
11	0h RW	<b>ATEIN:</b> APP FSM Timeout Error Injection This field when set indicates that Error Injection for APP FSM timeout is enabled.
10	0h RW	<b>CTEIN:</b> CSR FSM Timeout Error Injection This field when set indicates that Error Injection for CSR timeout is enabled.
9	0h RW	<b>RTEIN:</b> Rx FSM Timeout Error Injection This field when set indicates that Error Injection for RX FSM timeout is enabled.
8	0h RW	<b>TTEIN:</b> Tx FSM Timeout Error Injection This field when set indicates that Error Injection for TX FSM timeout is enabled.
7:2	0h RO	<b>Reserved</b>
1	0h RW	<b>PRTYEN:</b> This bit when set indicates that the FSM parity feature is enabled.
0	0h RW	<b>TMOUTEN:</b> This bit when set indicates that the FSM timeout feature is enabled.

#### 14.23.1.46 MAC\_FSM\_ACT\_TIMER – Offset 5020014Ch

This register is used to select the FSM and Interface Timeout values.

Type	Size	Offset	Default
MMIO	32 bit	5020014Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:20	0h RW	<b>LTMRMD:</b> This field provides the mode value to be used for large mode FSM and other interface time outs. The timeout duration based on the mode value is given below
19:16	0h RW	<b>NTMRMD:</b> This field provides the value to be used for normal mode FSM and other interface time outs. The timeout duration based on the mode value is given below
15:10	0h RO	<b>Reserved</b>
9:0	000h RW	<b>TMR:</b> This field indicates the number of CSR clocks required to generate 1us tic.

#### 14.23.1.47 SNPS\_SCS\_REG1 — Offset 50200150h

Synopsys Reserved Register

Type	Size	Offset	Default
MMIO	32 bit	50200150h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>MAC_SCS1:</b> Synopsys Reserved, All the bits must be set to "0". This field is reserved for Synopsys Internal use, and must always be set to "0" unless instructed by Synopsys. Setting any bit to "1" might cause unexpected behavior in the IP.

#### 14.23.1.48 MAC\_MDIO\_ADDRESS — Offset 50200200h

The MDIO Address register controls the management cycles to external PHY through a management interface.

Type	Size	Offset	Default
MMIO	32 bit	50200200h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	<b>Reserved</b>
27	0h RW	<b>PSE:</b> Preamble Suppression Enable When this bit is set, the SMA suppresses the 32-bit preamble and transmits MDIO frames with only 1 preamble bit. When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications.
26	0h RW	<b>BTB:</b> Back to Back transactions When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame. When this bit is reset, then the read/write command completion (GB is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame. This bit must not be set when NTC=0.
25:21	00h RW	<b>PA:</b> Physical Layer Address This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.
20:16	00h RW	<b>RDA:</b> Register/Device Address These bits select the PHY register in selected Clause 22 PHY device. These bits select the Device (MMD) in selected Clause 45 capable PHY.
15	0h RO	<b>Reserved</b>
14:12	0h RW	<b>NTC:</b> Number of Trailing Clocks This field controls the number of trailing clock cycles generated on gmii_mdc_o (MDC) after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 3'h3 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RW	<b>CR:</b> CSR Clock Range The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design: - 0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42 - 0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62 - 0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16 - 0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26 - 0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102 - 0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124 - 0110: CSR clock = 300-500 MHz; MDC clock = CSR clock/204 - 0111: CSR clock = 500-800 MHz; MDC clock = CSR clock/324 The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz frequency range. When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits as 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3. Program the following values only if the interfacing chips support faster MDC clocks: - 1000: CSR clock/4 - 1001: CSR clock/6 - 1010: CSR clock/8 - 1011: CSR clock/10 - 1100: CSR clock/12 - 1101: CSR clock/14 - 1110: CSR clock/16 - 1111: CSR clock/18 These bits are not used for accessing RevMII. These bits are read-only if the RevMII interface is selected as single PHY interface.
7:5	0h RO	<b>Reserved</b>
4	0h RW	<b>SKAP:</b> Skip Address Packet When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set.
3	0h RW	<b>GOC_1:</b> GMII Operation Command 1 This bit is higher bit of the operation command to the PHY or RevMII, GOC_1 and GOC_O is encoded as follows: - 00: Reserved - 01: Write - 10: Post Read Increment Address for Clause 45 PHY - 11: Read When Clause 22 PHY or RevMII is enabled, only Write and Read commands are valid.
2	0h RW	<b>GOC_0:</b> GMII Operation Command 0 This is the lower bit of the operation command to the PHY or RevMII. When in SMA mode (MDIO master) this bit along with GOC_1 determines the operation to be performed to the PHY. When only RevMII is selected in configuration this bit is read-only and tied to 1.
1	0h RW	<b>C45E:</b> Clause 45 PHY Enable When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO.
0	0h RW	<b>GB:</b> GMII Busy The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIO slave. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in MAC_MDIO_Address and MAC_MDIO_Data registers as long as this bit is set. For write transfers, the application must first write 16-bit data in the GDI field (and also RA field when C45E is set) in MAC_MDIO_Data register before setting this bit. When C45E is set, it should also write into the RA field of MAC_MDIO_Data register before initiating a read transfer. When a read transfer is completed (GB=0), the data read from the PHY register is valid in the GD field of the MAC_MDIO_Data register. Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

#### 14.23.1.49 MAC\_MDIO\_DATA – Offset 50200204h

The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in MAC\_MDIO\_Address. This register also stores the Read data from the PHY register located at the address specified by MDIO Address register.

Type	Size	Offset	Default
MMIO	32 bit	50200204h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>RA:</b> Register Address This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.
15:0	0000h RW	<b>GD:</b> GMII Data This field contains the 16-bit data value read from the PHY or RevMII after a Management Read operation or the 16-bit data value to be written to the PHY or RevMII before a Management Write operation.

#### 14.23.1.50 MAC\_GPIO\_CONTROL — Offset 50200208h

The GPIO Control register controls the GPIO.

Type	Size	Offset	Default
MMIO	32 bit	50200208h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19:16	0h RW	<b>GPI:</b> GPI Type When this bit is set, it indicates that the corresponding GPIS bit in MAC_GPIO_Status register is of latched-low (LL) type. When this bit is reset, it indicates that the corresponding GPIS is of latched-high (LH) type. The number of bits available in this field depends on the GP Input Signal Width option. Other bits are not used (reserved and always reset).
15:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>GPIE:</b> GPI Interrupt Enable When this bit is set and the programmed event (LL or LH) occurs on the corresponding GPIS bit of MAC_GPIO_Status register, the GPIIS bit of DMA_Interrupt_Status register is set and an interrupt is generated on the mci_intr_o or sbd_intr_o signal. The GPIIS bit is cleared when the application reads the Bits[7:0] of MAC_GPIO_Status register. When this bit is reset, the GPIIS bit is not set when any event occurs on the corresponding GPIS bits.

### 14.23.1.51 MAC\_GPIO\_STATUS – Offset 5020020Ch

The General Purpose IO register provides the control to drive the following: up to 16 bits of output ports (GPO) and status of up to 16 input ports (GPIS).

Type	Size	Offset	Default
MMIO	32 bit	5020020Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19:16	0h RW	<b>GPO:</b> General Purpose Output When this bit is set, it directly drives the gpo_o output ports. When this bit is reset, it does not directly drive the gpo_o output ports. The number of bits available in this field depends on the GP Input Signal Width option. Other bits are not used (reserved and always reset).
15:4	0h RO	<b>Reserved</b>
3:0	0h RW	<b>GPIS:</b> General Purpose Input Status This field gives the status of the signals connected to the gpi_i port. This field is of the following types based on the setting of the corresponding GPIT field of MAC_GPIO_Control register: - Latched-low (LL): This field is cleared when the corresponding gpi_i input becomes low. This field remains low until the application reads this field after which this field reflects the current value of gpi_i input. - Latched-high (LH): This field is set when the corresponding gpi_i input becomes high. This field remains high until the application reads this field after which this field reflects the current value of gpi_i input. The number of bits available in this field depends on the GP Input Signal Width option. Other bits are not used (reserved and always reset). 0000H

### 14.23.1.52 MAC\_ARP\_ADDRESS – Offset 50200210h

The ARP Address register contains the IPv4 Destination Address of the MAC.

Type	Size	Offset	Default
MMIO	32 bit	50200210h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>ARPPA:</b> ARP Protocol Address This field contains the IPv4 Destination Address of the MAC. This address is used for perfect match with the Protocol Address of Target field in the received ARP packet. This field is available only when the Enable IPv4 ARP Offload option is selected.

#### 14.23.1.53 MAC\_CSR\_SW\_CTRL – Offset 50200230h

This register contains SW programmable controls for changing the CSR access response and status bits clearing.

Type	Size	Offset	Default
MMIO	32 bit	50200230h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW	<b>SEEN:</b> Slave Error Response Enable When this bit is set, the MAC responds with Slave Error for accesses to reserved registers in CSR space. When this bit is reset, the MAC responds with Okay response to any register accessed from CSR space.
7:1	0h RO	<b>Reserved</b>
0	0h RW	<b>RCWE:</b> Register Clear on Write 1 Enable When this bit is set, the access mode of some register fields changes to Clear on Write 1, the application needs to set that respective bit to 1 to clear it. When this bit is reset, the access mode of these register fields remain as Clear on Read.

#### 14.23.1.54 MAC\_FPE\_CTRL\_STS – Offset 50200234h

This register controls the operation of Frame Preemption.

Type	Size	Offset	Default
MMIO	32 bit	50200234h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19	0h RW	<b>TRSP:</b> Transmitted Respond Frame Set when a Respond mPacket is transmitted (triggered by setting SRSP field). An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
18	0h RW	<b>TVER:</b> Transmitted Verify Frame Set when a Verify mPacket is transmitted (triggered by setting SVER field). An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
17	0h RW	<b>RRSP:</b> Received Respond Frame Set when a Respond mPacket is received. An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
16	0h RW	<b>RVER:</b> Received Verify Frame Set when a Verify mPacket is received. An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
15:4	0h RO	<b>Reserved</b>
3	0h RW	<b>S1_SET_0:</b> Synopsys Reserved, Must be set to "0". This field is reserved for Synopsys Internal use, and must always be set to "0" unless instructed by Synopsys. Setting to "1" might cause unexpected behavior in the IP.
2	0h RW	<b>SRSP:</b> Send Respond mPacket When set indicates hardware to send a Respond mPacket. Reset by hardware after sending the Respond mPacket. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
1	0h RW	<b>SVER:</b> Send Verify mPacket When set indicates hardware to send a verify mPacket. Reset by hardware after sending the Verify mPacket. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
0	0h RW	<b>EFPE:</b> Enable Tx Frame Preemption When set Frame Preemption Tx functionality is enabled.

#### 14.23.1.55 MAC\_EXT\_CFG1 — Offset 50200238h

This register contains Split mode control field and offset field for Split Header feature.

Type	Size	Offset	Default
MMIO	32 bit	50200238h	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	<b>Reserved</b>
9:8	0h RW	<b>SPLM:</b> Split Mode These bits indicate the mode of splitting the incoming Rx packets. They are
7	0h RO	<b>Reserved</b>
6:0	02h RW	<b>SPLOFST:</b> Split Offset These bits indicate the value of offset from the beginning of Length/Type field at which header split should take place when the appropriate SPLM is selected. The reset value of this field is 2 bytes indicating a split at L2 header. Value is in terms of bytes.

#### 14.23.1.56 MAC\_PRESN\_TIME\_NS — Offset 50200240h

This register contains the 32-bit binary rollover equivalent time of the PTP System Time in ns Exists when DWC\_EQOS\_FLEXI\_PPS\_OUT\_EN is configured

Type	Size	Offset	Default
MMIO	32 bit	50200240h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>MPTN:</b> MAC 1722 Presentation Time in ns These bits indicate the value of the 32-bit binary rollover equivalent time of the PTP System Time in ns

#### 14.23.1.57 MAC\_PRESN\_TIME\_UPDT — Offset 50200244h

This field holds the 32-bit value of MAC 1722 Presentation Time in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC\_Timestamp\_Control register). Exists when DWC\_EQOS\_FLEXI\_PPS\_OUT\_EN is configured

Type	Size	Offset	Default
MMIO	32 bit	50200244h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>MPTU:</b> MAC 1722 Presentation Time Update This field holds the init value or the update value for the presentation time. When used for update, this field holds the 32-bit value in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC_Timestamp_Control register). When ADDSUB field of MAC_System_Time_Nanoseconds_Update is set, this value is directly used for subtraction

#### 14.23.1.58 MAC\_ADDRESS0\_HIGH — Offset 50200300h

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the (G)MII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x112233445566 is received (0x11 in lane 0 of the first column) on the (G)MII as the destination address, then the MacAddress0 Register [47:0] is compared with 0x665544332211. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, then the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address0 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	50200300h	8000FFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO/V	<b>AE:</b> Address Enable This bit is always set to 1.
30:24	0h RO	<b>Reserved</b>
23:16	00h RW	<b>DCS:</b> DMA Channel Select If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address0 content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address0 content is routed.
15:0	FFFFh RW	<b>ADDRHI:</b> MAC Address0[47:32] This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

#### 14.23.1.59 MAC\_ADDRESS0\_LOW — Offset 50200304h

The MAC Address0 Low register holds the lower 32 bits of the 6-byte first MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	50200304h	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFh RW	<b>ADDRLO:</b> MAC Address0[31:0] This field contains the lower 32 bits of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

#### 14.23.1.60 MAC\_ADDRESS1\_HIGH — Offset 50200308h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when

Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Type	Size	Offset	Default
MMIO	32 bit	50200308h	0000FFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>AE:</b> Address Enable When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering.
30	0h RW	<b>SA:</b> Source Address When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet.
29:24	00h RW	<b>MBC:</b> Mask Byte Control These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address\${i}_High[15:8] - Bit 28: MAC_Address\${i}_High[7:0] - Bit 27: MAC_Address\${i}_Low[31:24] - ... - Bit 24: MAC_Address\${i}_Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23:16	00h RW	<b>DCS:</b> DMA Channel Select If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.
15:0	FFFFh RW	<b>ADDRHI:</b> MAC Address1 [47:32] This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

#### 14.23.1.61 MAC\_ADDRESS1\_LOW – Offset 5020030Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	5020030Ch	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFFFh RW	<b>ADDRLO:</b> MAC Address1 [31:0] This field contains the lower 32 bits of second 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.

#### 14.23.1.62 MAC\_ADDRESS2\_HIGH — Offset 50200310h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.63 MAC\_ADDRESS2\_LOW — Offset 50200314h

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.64 MAC\_ADDRESS3\_HIGH — Offset 50200318h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.65 MAC\_ADDRESS3\_LOW — Offset 5020031Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.66 MAC\_ADDRESS4\_HIGH — Offset 50200320h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.67 MAC\_ADDRESS4\_LOW — Offset 50200324h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.68 MAC\_ADDRESS5\_HIGH — Offset 50200328h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.69 MAC\_ADDRESS5\_LOW — Offset 5020032Ch**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.70 MAC\_ADDRESS6\_HIGH — Offset 50200330h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.71 MAC\_ADDRESS6\_LOW — Offset 50200334h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.72 MAC\_ADDRESS7\_HIGH – Offset 50200338h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.73 MAC\_ADDRESS7\_LOW – Offset 5020033Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.74 MAC\_ADDRESS8\_HIGH – Offset 50200340h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.75 MAC\_ADDRESS8\_LOW – Offset 50200344h

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.76 MAC\_ADDRESS9\_HIGH – Offset 50200348h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.77 MAC\_ADDRESS9\_LOW – Offset 5020034Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.78 MAC\_ADDRESS10\_HIGH – Offset 50200350h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.79 MAC\_ADDRESS10\_LOW – Offset 50200354h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.80 MAC\_ADDRESS11\_HIGH – Offset 50200358h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.81 MAC\_ADDRESS11\_LOW – Offset 5020035Ch**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.82 MAC\_ADDRESS12\_HIGH – Offset 50200360h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.83 MAC\_ADDRESS12\_LOW – Offset 50200364h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.84 MAC\_ADDRESS13\_HIGH – Offset 50200368h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.85 MAC\_ADDRESS13\_LOW – Offset 5020036Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.86 MAC\_ADDRESS14\_HIGH – Offset 50200370h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.87 MAC\_ADDRESS14\_LOW – Offset 50200374h

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.88 MAC\_ADDRESS15\_HIGH – Offset 50200378h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.89 MAC\_ADDRESS15\_LOW – Offset 5020037Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.90 MAC\_ADDRESS16\_HIGH – Offset 50200380h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.91 MAC\_ADDRESS16\_LOW – Offset 50200384h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.92 MAC\_ADDRESS17\_HIGH – Offset 50200388h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.93 MAC\_ADDRESS17\_LOW – Offset 5020038Ch**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.94 MAC\_ADDRESS18\_HIGH – Offset 50200390h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.95 MAC\_ADDRESS18\_LOW – Offset 50200394h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.96 MAC\_ADDRESS19\_HIGH – Offset 50200398h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.97 MAC\_ADDRESS19\_LOW – Offset 5020039Ch

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.98 MAC\_ADDRESS20\_HIGH – Offset 502003A0h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.99 MAC\_ADDRESS20\_LOW – Offset 502003A4h

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### 14.23.1.100 MAC\_ADDRESS21\_HIGH – Offset 502003A8h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### 14.23.1.101 MAC\_ADDRESS21\_LOW – Offset 502003ACh

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.102MAC\_ADDRESS22\_HIGH – Offset 502003B0h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.103MAC\_ADDRESS22\_LOW – Offset 502003B4h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.104MAC\_ADDRESS23\_HIGH – Offset 502003B8h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.105MAC\_ADDRESS23\_LOW – Offset 502003BCh**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.106MAC\_ADDRESS24\_HIGH – Offset 502003C0h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.107MAC\_ADDRESS24\_LOW – Offset 502003C4h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.108MAC\_ADDRESS25\_HIGH – Offset 502003C8h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.109MAC\_ADDRESS25\_LOW – Offset 502003CCh**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.110MAC\_ADDRESS26\_HIGH – Offset 502003D0h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.111MAC\_ADDRESS26\_LOW – Offset 502003D4h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

#### **14.23.1.112MAC\_ADDRESS27\_HIGH – Offset 502003D8h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

#### **14.23.1.113MAC\_ADDRESS27\_LOW – Offset 502003DCh**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

### **14.23.1.114MAC\_ADDRESS28\_HIGH – Offset 502003E0h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

### **14.23.1.115MAC\_ADDRESS28\_LOW – Offset 502003E4h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

### **14.23.1.116MAC\_ADDRESS29\_HIGH – Offset 502003E8h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

### **14.23.1.117MAC\_ADDRESS29\_LOW – Offset 502003ECh**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

### **14.23.1.118MAC\_ADDRESS30\_HIGH – Offset 502003F0h**

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

### **14.23.1.119MAC\_ADDRESS30\_LOW – Offset 502003F4h**

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:**

Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

### 14.23.1.120MAC\_ADDRESS31\_HIGH — Offset 502003F8h

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_HIGH, offset 50200308h.

### 14.23.1.121MAC\_ADDRESS31\_LOW — Offset 502003FCh

The MAC Address1 Low register holds the lower 32 bits of the second 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS1\_LOW, offset 5020030Ch.

### 14.23.1.122MAC\_ADDRESS32\_HIGH — Offset 50200400h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

Type	Size	Offset	Default
MMIO	32 bit	50200400h	0000FFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>AE:</b> Address Enable When this bit is set, the Address filter module uses the 33rd MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering.
30:19	0h RO	<b>Reserved</b>
18:16	0h RW	<b>DCS:</b> DMA Channel Select This field contains the DMA Channel number to which an Rx packet whose DA matches the MAC Address32 content is routed.
15:0	FFFFh RW	<b>ADDRHI:</b> MAC Address32 [47:32] This field contains the upper 16 bits (47:32) of the 33rd 6-byte MAC address.

### 14.23.1.123MAC\_ADDRESS32\_LOW – Offset 50200404h

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

Type	Size	Offset	Default
MMIO	32 bit	50200404h	FFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFh RW	<b>ADDRLO:</b> MAC Address32 [31:0] This field contains the lower 32 bits of the 33rd 6-byte MAC address. The content of this field is undefined until loaded by the Application after the initialization process.

### 14.23.1.124MAC\_ADDRESS33\_HIGH – Offset 50200408h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

### 14.23.1.125MAC\_ADDRESS33\_LOW – Offset 5020040Ch

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

### 14.23.1.126MAC\_ADDRESS34\_HIGH – Offset 50200410h

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.127MAC\_ADDRESS34\_LOW – Offset 50200414h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.128MAC\_ADDRESS35\_HIGH – Offset 50200418h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.129MAC\_ADDRESS35\_LOW – Offset 5020041Ch**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.130MAC\_ADDRESS36\_HIGH – Offset 50200420h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.131MAC\_ADDRESS36\_LOW – Offset 50200424h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.132MAC\_ADDRESS37\_HIGH – Offset 50200428h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.133MAC\_ADDRESS37\_LOW – Offset 5020042Ch**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.134MAC\_ADDRESS38\_HIGH – Offset 50200430h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.135MAC\_ADDRESS38\_LOW – Offset 50200434h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.136MAC\_ADDRESS39\_HIGH – Offset 50200438h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.137MAC\_ADDRESS39\_LOW – Offset 5020043Ch**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.138MAC\_ADDRESS40\_HIGH – Offset 50200440h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.139MAC\_ADDRESS40\_LOW – Offset 50200444h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.140MAC\_ADDRESS41\_HIGH – Offset 50200448h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.141MAC\_ADDRESS41\_LOW – Offset 5020044Ch**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.142MAC\_ADDRESS42\_HIGH – Offset 50200450h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.143MAC\_ADDRESS42\_LOW – Offset 50200454h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.144MAC\_ADDRESS43\_HIGH – Offset 50200458h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.145MAC\_ADDRESS43\_LOW – Offset 5020045Ch**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.146MAC\_ADDRESS44\_HIGH – Offset 50200460h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.147MAC\_ADDRESS44\_LOW – Offset 50200464h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.148MAC\_ADDRESS45\_HIGH – Offset 50200468h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.149MAC\_ADDRESS45\_LOW – Offset 5020046Ch**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.150MAC\_ADDRESS46\_HIGH – Offset 50200470h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.151MAC\_ADDRESS46\_LOW – Offset 50200474h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.152MAC\_ADDRESS47\_HIGH – Offset 50200478h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.153MAC\_ADDRESS47\_LOW – Offset 5020047Ch**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.154MAC\_ADDRESS48\_HIGH – Offset 50200480h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.155MAC\_ADDRESS48\_LOW – Offset 50200484h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.156MAC\_ADDRESS49\_HIGH – Offset 50200488h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.157MAC\_ADDRESS49\_LOW – Offset 5020048Ch**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.158MAC\_ADDRESS50\_HIGH – Offset 50200490h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.159MAC\_ADDRESS50\_LOW – Offset 50200494h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.160MAC\_ADDRESS51\_HIGH – Offset 50200498h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.161MAC\_ADDRESS51\_LOW – Offset 5020049Ch**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.162MAC\_ADDRESS52\_HIGH – Offset 502004A0h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.163MAC\_ADDRESS52\_LOW – Offset 502004A4h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.164MAC\_ADDRESS53\_HIGH – Offset 502004A8h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.165MAC\_ADDRESS53\_LOW – Offset 502004ACh**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.166MAC\_ADDRESS54\_HIGH – Offset 502004B0h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.167MAC\_ADDRESS54\_LOW – Offset 502004B4h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.168MAC\_ADDRESS55\_HIGH – Offset 502004B8h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.169MAC\_ADDRESS55\_LOW – Offset 502004BCh**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.170MAC\_ADDRESS56\_HIGH – Offset 502004C0h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.171MAC\_ADDRESS56\_LOW – Offset 502004C4h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.172MAC\_ADDRESS57\_HIGH – Offset 502004C8h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.173MAC\_ADDRESS57\_LOW – Offset 502004CCh**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.174MAC\_ADDRESS58\_HIGH – Offset 502004D0h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.175MAC\_ADDRESS58\_LOW – Offset 502004D4h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.176MAC\_ADDRESS59\_HIGH – Offset 502004D8h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.177MAC\_ADDRESS59\_LOW – Offset 502004DCh**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.178MAC\_ADDRESS60\_HIGH – Offset 502004E0h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.179MAC\_ADDRESS60\_LOW – Offset 502004E4h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.180MAC\_ADDRESS61\_HIGH – Offset 502004E8h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.181MAC\_ADDRESS61\_LOW – Offset 502004ECh**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.182MAC\_ADDRESS62\_HIGH – Offset 502004F0h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.183MAC\_ADDRESS62\_LOW – Offset 502004F4h**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.184MAC\_ADDRESS63\_HIGH – Offset 502004F8h**

The MAC Address32 High register holds the upper 16 bits of the 33rd 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address Low Register are written. For proper synchronization updates, you should perform the consecutive writes to the MAC Address Low Register after at least four clock cycles of the destination clock.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_HIGH, offset 50200400h.

#### **14.23.1.185MAC\_ADDRESS63\_LOW – Offset 502004FCh**

The MAC Address32 Low register holds the lower 16 bits of the 33rd 6-byte MAC address of the station.

**Note:** Bit definitions are the same as MAC\_ADDRESS32\_LOW, offset 50200404h.

#### **14.23.1.186MMC\_CONTROL – Offset 50200700h**

This register establishes the operating mode of MMC.

Type	Size	Offset	Default
MMIO	32 bit	50200700h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW	<b>UCDBC:</b> Update MMC Counters for Dropped Broadcast Packets Note: The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set. When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of MAC_Packet_Filter register. When reset, the MMC Counters are not updated for dropped Broadcast packets.
7:6	0h RO	<b>Reserved</b>
5	0h RW	<b>CNTPRSTLVL:</b> Full-Half Preset When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2KBytes) and all packet-counters gets preset to 0x7FFF_FFF0 (Half 16). When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2KBytes) and all packet-counters gets preset to 0xFFFF_FFF0 (Full 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFFF.
4	0h RW	<b>CNTPRST:</b> Counters Preset When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle. This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets.
3	0h RW	<b>CNTFREEZ:</b> MMC Counter Freeze When this bit is set, it freezes all MMC counters to their current value. Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode.
2	0h RW	<b>RSTONRD:</b> Reset on Read When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read.
1	0h RW	<b>CNTSTOPRO:</b> Counter Stop Rollover When this bit is set, the counter does not roll over to zero after reaching the maximum value.
0	0h RW	<b>CNTRST:</b> Counters Reset When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets.

### 14.23.1.187MMC\_RX\_INTERRUPT — Offset 50200704h

This register maintains the interrupts generated from all Receive statistics counters. The MMC Receive Interrupt register maintains the interrupts that are generated when the following occur: - Receive statistic counters reach half of their maximum values (0x8000\_0000 for 32 bit counter and 0x8000 for 16 bit counter). - Receive statistic counters cross their maximum values (0xFFFF\_FFFF for 32 bit counter and 0xFFFF for 16 bit counter). When the Counter Stop Rollover is set, interrupts are set but the counter remains at all-ones. The MMC Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit. Note: R\_SS\_RC means that this register bit is set internally, and it is cleared when the Counter register is read.

Type	Size	Offset	Default

5	0h RO/V	<b>RXCRCERPIS:</b> MMC Receive CRC Error Packet Counter Interrupt Status This bit is set when the rxcrcerror counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
4	0h RO/V	<b>RXMCGPIS:</b> MMC Receive Multicast Good Packet Counter Interrupt Status This bit is set when the rxmulticastpackets_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
3	0h RO/V	<b>RXBGPIS:</b> MMC Receive Broadcast Good Packet Counter Interrupt Status This bit is set when the rxbroadcastpackets_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
2	0h RO/V	<b>RXGOCTIS:</b> MMC Receive Good Octet Counter Interrupt Status This bit is set when the rxoctetcount_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
1	0h RO/V	<b>RXGBOCTIS:</b> MMC Receive Good Bad Octet Counter Interrupt Status This bit is set when the rxoctetcount_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
0	0h RO/V	<b>RXGBPKTIS:</b> MMC Receive Good Bad Packet Counter Interrupt Status This bit is set when the rxpacketcount_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.

#### 14.23.1.188MMC\_TX\_INTERRUPT — Offset 50200708h

This register maintains the interrupts generated from all Transmit statistics counters. The MMC Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000\_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF\_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Type	Size	Offset	Default

27	0h RO/V	<b>TXLPITRCIS:</b> MMC Transmit LPI transition counter interrupt status This bit is set when the Tx_LPI_Tran_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
26	0h RO/V	<b>TXLPIUSCIS:</b> MMC Transmit LPI microsecond counter interrupt status This bit is set when the Tx_LPI_USEC_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
25	0h RO/V	<b>TXOSIZEGPIS:</b> MMC Transmit Oversize Good Packet Counter Interrupt Status This bit is set when the txoversize_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
24	0h RO/V	<b>TXVLANGPIS:</b> MMC Transmit VLAN Good Packet Counter Interrupt Status This bit is set when the txvlanpackets_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
23	0h RO/V	<b>TXPAUSPIS:</b> MMC Transmit Pause Packet Counter Interrupt Status This bit is set when the txpausepacketerror counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
22	0h RO/V	<b>TXEXDEFPIS:</b> MMC Transmit Excessive Deferral Packet Counter Interrupt Status This bit is set when the txexcessdef counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
21	0h RO/V	<b>TXGPKTIS:</b> MMC Transmit Good Packet Counter Interrupt Status This bit is set when the txpacketcount_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
20	0h RO/V	<b>TXGOCTIS:</b> MMC Transmit Good Octet Counter Interrupt Status This bit is set when the txoctetcount_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
19	0h RO/V	<b>TXCARERPIS:</b> MMC Transmit Carrier Error Packet Counter Interrupt Status This bit is set when the txcarriererror counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
18	0h RO/V	<b>TXEXCOLPIS:</b> MMC Transmit Excessive Collision Packet Counter Interrupt Status This bit is set when the txexcesscol counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO/V	<b>TXLATCOLPIS:</b> MMC Transmit Late Collision Packet Counter Interrupt Status This bit is set when the txlatecol counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
16	0h RO/V	<b>TXDEFPI:</b> MMC Transmit Deferred Packet Counter Interrupt Status This bit is set when the txdeferred counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15	0h RO/V	<b>TXMCOLGPIS:</b> MMC Transmit Multiple Collision Good Packet Counter Interrupt Status This bit is set when the txmulticol_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
14	0h RO/V	<b>TXSCOLGPIS:</b> MMC Transmit Single Collision Good Packet Counter Interrupt Status This bit is set when the txsinglecol_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
13	0h RO/V	<b>TXUFLOWERPIS:</b> MMC Transmit Underflow Error Packet Counter Interrupt Status This bit is set when the txunderflowerror counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
12	0h RO/V	<b>TXBCGPIS:</b> MMC Transmit Broadcast Good Bad Packet Counter Interrupt Status This bit is set when the txbroadcastpackets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
11	0h RO/V	<b>TXMCGBPIS:</b> MMC Transmit Multicast Good Bad Packet Counter Interrupt Status The bit is set when the txmulticastpackets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
10	0h RO/V	<b>TXUCGPIS:</b> MMC Transmit Unicast Good Bad Packet Counter Interrupt Status This bit is set when the txunicastpackets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
9	0h RO/V	<b>TX1024TMAXOCTGBPIS:</b> MMC Transmit 1024 to Maximum Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx1024tomaxoctets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
8	0h RO/V	<b>TX512T1023OCTGBPIS:</b> MMC Transmit 512 to 1023 Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx512to1023octets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
7	0h RO/V	<b>TX256T511OCTGBPIS:</b> MMC Transmit 256 to 511 Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx256to511octets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
6	0h RO/V	<b>TX128T255OCTGBPIS:</b> MMC Transmit 128 to 255 Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx128to255octets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO/V	<b>TX65T127OCTGPBIS:</b> MMC Transmit 65 to 127 Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx65to127octets_gb counter reaches half the maximum value, and also when it reaches the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
4	0h RO/V	<b>TX64OCTGPBIS:</b> MMC Transmit 64 Octet Good Bad Packet Counter Interrupt Status This bit is set when the tx64octets_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
3	0h RO/V	<b>TXMCGPIS:</b> MMC Transmit Multicast Good Packet Counter Interrupt Status This bit is set when the txmulticastpackets_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
2	0h RO/V	<b>TXBCGPIS:</b> MMC Transmit Broadcast Good Packet Counter Interrupt Status This bit is set when the txbroadcastpackets_g counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
1	0h RO/V	<b>TXGBPktIS:</b> MMC Transmit Good Bad Packet Counter Interrupt Status This bit is set when the txpacketcount_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.
0	0h RO/V	<b>TXGBOCTIS:</b> MMC Transmit Good Bad Octet Counter Interrupt Status This bit is set when the txoctetcount_gb counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event.

#### 14.23.1.189MMC\_RX\_INTERRUPT\_MASK — Offset 5020070Ch

This register maintains the masks for interrupts generated from all Receive statistics counters. The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when receive statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

Type	Size	Offset	Default
MMIO	32 bit	5020070Ch	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXMCASTGB:</b> Tx Multicast Packets Good Bad This field indicates the number of good and bad multicast packets transmitted.

#### 14.23.1.203TX\_BROADCAST\_PACKETS\_GOOD\_BAD – Offset 50200744h

This register provides the number of good and bad broadcast packets transmitted by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	50200744h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXBCASTGB:</b> Tx Broadcast Packets Good Bad This field indicates the number of good and bad broadcast packets transmitted.

#### 14.23.1.204TX\_UNDERFLOW\_ERROR\_PACKETS – Offset 50200748h

This register provides the number of packets aborted by DWC\_ether\_qos because of packets underflow error.

Type	Size	Offset	Default
MMIO	32 bit	50200748h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXUNDRFLW:</b> Tx Underflow Error Packets This field indicates the number of packets aborted because of packets underflow error.

#### 14.23.1.205TX\_SINGLE\_COLLISION\_GOOD\_PACKETS – Offset 5020074Ch

This register provides the number of successfully transmitted packets by DWC\_ether\_qos after a single collision in the half-duplex mode.

Type	Size	Offset	Default
MMIO	32 bit	5020074Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXSNGLCOLG:</b> Tx Single Collision Good Packets This field indicates the number of successfully transmitted packets after a single collision in the half-duplex mode.

#### 14.23.1.206TX\_MULTIPLE\_COLLISION\_GOOD\_PACKETS – Offset 50200750h

This register provides the number of successfully transmitted packets by DWC\_ether\_qos after multiple collisions in the half-duplex mode.

Type	Size	Offset	Default
MMIO	32 bit	50200750h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXMULTCOLG:</b> Tx Multiple Collision Good Packets This field indicates the number of successfully transmitted packets after multiple collisions in the half-duplex mode.

#### 14.23.1.207TX\_DEFERRED\_PACKETS – Offset 50200754h

This register provides the number of successfully transmitted by DWC\_ether\_qos after a deferral in the half-duplex mode.

Type	Size	Offset	Default
MMIO	32 bit	50200754h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXDEFRD:</b> Tx Deferred Packets This field indicates the number of successfully transmitted after a deferral in the half-duplex mode.

#### 14.23.1.208TX\_LATE\_COLLISION\_PACKETS – Offset 50200758h

This register provides the number of packets aborted by DWC\_ether\_qos because of late collision error.

Type	Size	Offset	Default
MMIO	32 bit	50200758h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXLATECOL:</b> Tx Late Collision Packets This field indicates the number of packets aborted because of late collision error.

#### 14.23.1.209TX\_EXCESSIVE\_COLLISION\_PACKETS – Offset 5020075Ch

This register provides the number of packets aborted by DWC\_ether\_qos because of excessive (16) collision errors.

Type	Size	Offset	Default
MMIO	32 bit	5020075Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXEXSCOL:</b> Tx Excessive Collision Packets This field indicates the number of packets aborted because of excessive (16) collision errors.

#### 14.23.1.210TX\_CARRIER\_ERROR\_PACKETS – Offset 50200760h

This register provides the number of packets aborted by DWC\_ether\_qos because of carrier sense error (no carrier or loss of carrier).

Type	Size	Offset	Default
MMIO	32 bit	50200760h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXCARR:</b> Tx Carrier Error Packets This field indicates the number of packets aborted because of carrier sense error (no carrier or loss of carrier).

#### 14.23.1.211TX\_OCTET\_COUNT\_GOOD – Offset 50200764h

This register provides the number of bytes transmitted by DWC\_ether\_qos, exclusive of preamble, only in good packets.

Type	Size	Offset	Default
MMIO	32 bit	50200764h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXOCTG:</b> Tx Octet Count Good This field indicates the number of bytes transmitted, exclusive of preamble, only in good packets.

#### 14.23.1.212TX\_PACKET\_COUNT\_GOOD – Offset 50200768h

This register provides the number of good packets transmitted by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	50200768h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXPKTG:</b> Tx Packet Count Good This field indicates the number of good packets transmitted.

#### 14.23.1.213TX\_EXCESSIVE\_DEFERRAL\_ERROR – Offset 5020076Ch

This register provides the number of packets aborted by DWC\_ether\_qos because of excessive deferral error (deferred for more than two max-sized packet times).

Type	Size	Offset	Default
MMIO	32 bit	5020076Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXEXSDEF:</b> Tx Excessive Deferral Error This field indicates the number of packets aborted because of excessive deferral error (deferred for more than two max-sized packet times).

#### 14.23.1.214 TX\_PAUSE\_PACKETS — Offset 50200770h

This register provides the number of good Pause packets transmitted by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	50200770h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXPAUSE:</b> Tx Pause Packets This field indicates the number of good Pause packets transmitted.

#### 14.23.1.215 TX\_VLAN\_PACKETS\_GOOD — Offset 50200774h

This register provides the number of good VLAN packets transmitted by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	50200774h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXVLANG:</b> Tx VLAN Packets Good This field provides the number of good VLAN packets transmitted.

#### 14.23.1.216TX\_OSIZE\_PACKETS\_GOOD – Offset 50200778h

This register provides the number of packets transmitted by DWC\_ether\_qos without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the MAC\_Configuration register).

Type	Size	Offset	Default
MMIO	32 bit	50200778h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXOSIZG:</b> Tx OSize Packets Good This field indicates the number of packets transmitted without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the MAC_Configuration register).

#### 14.23.1.217RX\_PACKETS\_COUNT\_GOOD\_BAD – Offset 50200780h

This register provides the number of good and bad packets received by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	50200780h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXPKTGB:</b> Rx Packets Count Good Bad This field indicates the number of good and bad packets received.

#### 14.23.1.218RX\_OCTET\_COUNT\_GOOD\_BAD – Offset 50200784h

This register provides the number of bytes received by DWC\_ther\_qos, exclusive of preamble, in good and bad packets.

Type	Size	Offset	Default
MMIO	32 bit	50200784h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXOCTGB:</b> Rx Octet Count Good Bad This field indicates the number of bytes received, exclusive of preamble, in good and bad packets.

#### 14.23.1.219RX\_OCTET\_COUNT\_GOOD – Offset 50200788h

This register provides the number of bytes received by DWC\_ether\_qos, exclusive of preamble, only in good packets.

Type	Size	Offset	Default
MMIO	32 bit	50200788h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXOCTG:</b> Rx Octet Count Good This field indicates the number of bytes received, exclusive of preamble, only in good packets.

#### 14.23.1.220RX\_BROADCAST\_PACKETS\_GOOD – Offset 5020078Ch

This register provides the number of good broadcast packets received by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	5020078Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXBCASTG:</b> Rx Broadcast Packets Good This field indicates the number of good broadcast packets received.

#### 14.23.1.221RX\_MULTICAST\_PACKETS\_GOOD – Offset 50200790h

This register provides the number of good multicast packets received by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	50200790h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXMCSTG:</b> Rx Multicast Packets Good This field indicates the number of good multicast packets received.

#### 14.23.1.222RX\_CRC\_ERROR\_PACKETS — Offset 50200794h

This register provides the number of packets received by DWC\_ether\_qos with CRC error.

Type	Size	Offset	Default
MMIO	32 bit	50200794h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXCRCERR:</b> Rx CRC Error Packets This field indicates the number of packets received with CRC error.

#### 14.23.1.223RX\_ALIGNMENT\_ERROR\_PACKETS — Offset 50200798h

This register provides the number of packets received by DWC\_ether\_qos with alignment (dribble) error. It is valid only in 10/100 mode.

Type	Size	Offset	Default
MMIO	32 bit	50200798h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXALGNERR:</b> Rx Alignment Error Packets This field indicates the number of packets received with alignment (dribble) error. It is valid only in 10/100 mode.

#### 14.23.1.224RX\_RUNT\_ERROR\_PACKETS – Offset 5020079Ch

This register provides the number of packets received by DWC\_ether\_qos with runt (length less than 64 bytes and CRC error) error.

Type	Size	Offset	Default
MMIO	32 bit	5020079Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXRUNTERR:</b> Rx Runt Error Packets This field indicates the number of packets received with runt (length less than 64 bytes and CRC error) error.

#### 14.23.1.225RX\_JABBER\_ERROR\_PACKETS – Offset 502007A0h

This register provides the number of giant packets received by DWC\_ether\_qos with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

Type	Size	Offset	Default
MMIO	32 bit	502007A0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXJABERR:</b> Rx Jabber Error Packets This field indicates the number of giant packets received with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

#### 14.23.1.226RX\_UNDERSIZE\_PACKETS\_GOOD — Offset 502007A4h

This register provides the number of packets received by DWC\_ether\_qos with length less than 64 bytes, without any errors.

Type	Size	Offset	Default
MMIO	32 bit	502007A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXUNDERSZG:</b> Rx Undersize Packets Good This field indicates the number of packets received with length less than 64 bytes, without any errors.

#### 14.23.1.227RX\_OVERSIZE\_PACKETS\_GOOD — Offset 502007A8h

This register provides the number of packets received by DWC\_ether\_qos without errors, with length greater than the maxsize (1,518 bytes or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in the S2KP bit of the MAC\_Configuration register).

Type	Size	Offset	Default
MMIO	32 bit	502007A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXOVERSZG:</b> Rx Oversize Packets Good This field indicates the number of packets received without errors, with length greater than the maxsize (1,518 bytes or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in the S2KP bit of the MAC_Configuration register).

#### 14.23.1.228RX\_64OCTETS\_PACKETS\_GOOD\_BAD – Offset 502007ACh

This register provides the number of good and bad packets received by DWC\_ether\_qos with length 64 bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	502007ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RX64OCTGB:</b> Rx 64 Octets Packets Good Bad This field indicates the number of good and bad packets received with length 64 bytes, exclusive of the preamble.

#### 14.23.1.229RX\_65TO127OCTETS\_PACKETS\_GOOD\_BAD – Offset 502007B0h

This register provides the number of good and bad packets received by DWC\_ether\_qos with length between 65 and 127 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	502007B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RX65_127OCTGB:</b> Rx 65-127 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 65 and 127 (inclusive) bytes, exclusive of the preamble.

#### 14.23.1.230RX\_128TO255OCTETS\_PACKETS\_GOOD\_BAD – Offset 502007B4h

This register provides the number of good and bad packets received by DWC\_ether\_qos with length between 128 and 255 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	502007B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RX128_255OCTGB:</b> Rx 128-255 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 128 and 255 (inclusive) bytes, exclusive of the preamble.

#### 14.23.1.231RX\_256TO511OCTETS\_PACKETS\_GOOD\_BAD – Offset 502007B8h

This register provides the number of good and bad packets received by DWC\_ether\_qos with length between 256 and 511 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	502007B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RX256_511OCTGB:</b> Rx 256-511 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 256 and 511 (inclusive) bytes, exclusive of the preamble.

#### **14.23.1.232RX\_512TO1023OCTETS\_PACKETS\_GOOD\_BAD – Offset 502007BCh**

This register provides the number of good and bad packets received by DWC\_ether\_qos with length between 512 and 1023 (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	502007BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RX512_1023OCTGB:</b> RX 512-1023 Octets Packets Good Bad This field indicates the number of good and bad packets received with length between 512 and 1023 (inclusive) bytes, exclusive of the preamble.

#### **14.23.1.233RX\_1024TOMAXOCTETS\_PACKETS\_GOOD\_BAD – Offset 502007C0h**

This register provides the number of good and bad packets received by DWC\_ether\_qos with length between 1024 and maxsize (inclusive) bytes, exclusive of the preamble.

Type	Size	Offset	Default
MMIO	32 bit	502007C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RX1024_MAXOCTGB:</b> Rx 1024-Max Octets Good Bad This field indicates the number of good and bad packets received with length between 1024 and maxsize (inclusive) bytes, exclusive of the preamble.

#### 14.23.1.234RX\_UNICAST\_PACKETS\_GOOD — Offset 502007C4h

This register provides the number of good unicast packets received by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	502007C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXUCASTG:</b> Rx Unicast Packets Good This field indicates the number of good unicast packets received.

#### 14.23.1.235RX\_LENGTH\_ERROR\_PACKETS — Offset 502007C8h

This register provides the number of packets received by DWC\_ether\_qos with length error (Length Type field not equal to packet size), for all packets with valid length field.

Type	Size	Offset	Default
MMIO	32 bit	502007C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXLENERR:</b> Rx Length Error Packets This field indicates the number of packets received with length error (Length Type field not equal to packet size), for all packets with valid length field.

#### 14.23.1.236RX\_OUT\_OF\_RANGE\_TYPE\_PACKETS — Offset 502007CCh

This register provides the number of packets received by DWC\_ether\_qos with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

Type	Size	Offset	Default
MMIO	32 bit	502007CCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXOUTOFRNG:</b> Rx Out of Range Type Packet This field indicates the number of packets received with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

#### 14.23.1.237RX\_PAUSE\_PACKETS — Offset 502007D0h

This register provides the number of good and valid Pause packets received by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	502007D0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXPAUSEPKT:</b> Rx Pause Packets This field indicates the number of good and valid Pause packets received.

#### 14.23.1.238RX\_FIFO\_OVERFLOW\_PACKETS – Offset 502007D4h

This register provides the number of missed received packets because of FIFO overflow in DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	502007D4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXFIFOVFL:</b> Rx FIFO Overflow Packets This field indicates the number of missed received packets because of FIFO overflow.

#### 14.23.1.239RX\_VLAN\_PACKETS\_GOOD\_BAD – Offset 502007D8h

This register provides the number of good and bad VLAN packets received by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	502007D8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXVLANPKTGB:</b> Rx VLAN Packets Good Bad This field indicates the number of good and bad VLAN packets received.

#### 14.23.1.240RX\_WATCHDOG\_ERROR\_PACKETS – Offset 502007DCh

This register provides the number of packets received by DWC\_ether\_qos with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in MAC\_Configuration register), 10,240 bytes (when JE bit is set and WD bit is reset in MAC\_Configuration register), 16,384 bytes (when WD bit is set in MAC\_Configuration register) or the value programmed in the MAC\_Watchdog\_Timeout register).

Type	Size	Offset	Default
MMIO	32 bit	502007DCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXWDGERR:</b> Rx Watchdog Error Packets This field indicates the number of packets received with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in MAC_Configuration register), 10,240 bytes (when JE bit is set and WD bit is reset in MAC_Configuration register), 16,384 bytes (when WD bit is set in MAC_Configuration register) or the value programmed in the MAC_Watchdog_Timeout register).

#### 14.23.1.241RX\_RECEIVE\_ERROR\_PACKETS – Offset 502007E0h

This register provides the number of packets received by DWC\_ether\_qos with Receive error or Packet Extension error on the GMII or MII interface.

Type	Size	Offset	Default
MMIO	32 bit	502007E0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXRCVERR:</b> Rx Receive Error Packets This field indicates the number of packets received with Receive error or Packet Extension error on the GMII or MII interface.

#### 14.23.1.242RX\_CONTROL\_PACKETS\_GOOD – Offset 502007E4h

This register provides the number of good control packets received by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	502007E4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXCTRLG:</b> Rx Control Packets Good This field indicates the number of good control packets received.

#### 14.23.1.243TX\_LPI\_USEC\_CNTR – Offset 502007ECh

This register provides the number of microseconds Tx LPI is asserted by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	502007ECh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXLPIUSC:</b> Tx LPI Microseconds Counter This field indicates the number of microseconds Tx LPI is asserted. For every Tx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

#### 14.23.1.244 TX\_LPI\_TRAN\_CNTR — Offset 502007F0h

This register provides the number of times DWC\_ether\_qos has entered Tx LPI.

Type	Size	Offset	Default
MMIO	32 bit	502007F0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXLPITRC:</b> Tx LPI Transition counter This field indicates the number of times Tx LPI Entry has occurred. Even if Tx LPI Entry occurs in Automate Mode (because of LPITXA bit set in the LPI Control and Status register), the counter increments.

#### 14.23.1.245 RX\_LPI\_USEC\_CNTR — Offset 502007F4h

This register provides the number of microseconds Rx LPI is sampled by DWC\_ether\_qos.

Type	Size	Offset	Default
MMIO	32 bit	502007F4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXLPIUSC:</b> Rx LPI Microseconds Counter This field indicates the number of microseconds Rx LPI is asserted. For every Rx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

#### 14.23.1.246RX\_LPI\_TRAN\_CNTR — Offset 502007F8h

This register provides the number of times DWC\_ether\_qos has entered Rx LPI.

Type	Size	Offset	Default
MMIO	32 bit	502007F8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXLPIITRC:</b> Rx LPI Transition counter This field indicates the number of times Rx LPI Entry has occurred.

#### 14.23.1.247MMC\_IPC\_RX\_INTERRUPT\_MASK — Offset 50200800h

This register maintains the mask for the interrupt generated from the receive IPC statistic counters. The MMC Receive Checksum Off load Interrupt Mask register maintains the masks for the interrupts generated when the receive IPC (Checksum Off load) statistic counters reach half their maximum value, and when they reach their maximum values. This register is 32 bits wide.

Type	Size	Offset	Default
MMIO	32 bit	50200800h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	<b>Reserved</b>
29	0h RW	<b>RXICMPEROIM:</b> MMC Receive ICMP Error Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxicmp_err_octets counter reaches half of the maximum value or the maximum value.
28	0h RW	<b>RXICMPGOIM:</b> MMC Receive ICMP Good Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxicmp_gd_octets counter reaches half of the maximum value or the maximum value.
27	0h RW	<b>RXTCPEROIM:</b> MMC Receive TCP Error Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxtcp_err_octets counter reaches half of the maximum value or the maximum value.

23	0h RW	<b>RXIPV6NOPAYOIM:</b> MMC Receive IPV6 Header Error Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv6_nopay_octets counter reaches half of the maximum value or the maximum value.
22	0h RW	<b>RXIPV6HEROIM:</b> MMC Receive IPV6 Good Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv6_hderrr_octets counter reaches half of the maximum value or the maximum value.
21	0h RW	<b>RXIPV6GOIM:</b> MMC Receive IPV6 Good Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv6_gd_octets counter reaches half of the maximum value or the maximum value.
20	0h RW	<b>RXIPV4UDSBL0IM:</b> MMC Receive IPV4 UDP Checksum Disabled Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_udtbl_octets counter reaches half of the maximum value or the maximum value.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	<b>RXIPV4FRAGOIM:</b> MMC Receive IPV4 Fragmented Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_frag_octets counter reaches half of the maximum value or the maximum value.
18	0h RW	<b>RXIPV4NOPAYOIM:</b> MMC Receive IPV4 No Payload Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_nopay_octets counter reaches half of the maximum value or the maximum value.
17	0h RW	<b>RXIPV4HEROIM:</b> MMC Receive IPV4 Header Error Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_hdrerr_octets counter reaches half of the maximum value or the maximum value.
16	0h RW	<b>RXIPV4GOIM:</b> MMC Receive IPV4 Good Octet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_gd_octets counter reaches half of the maximum value or the maximum value.
15:14	0h RO	<b>Reserved</b>
13	0h RW	<b>RXICMPERRPIM:</b> MMC Receive ICMP Error Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxicmp_err_pkts counter reaches half of the maximum value or the maximum value.
12	0h RW	<b>RXICMPGPIM:</b> MMC Receive ICMP Good Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxicmp_gd_pkts counter reaches half of the maximum value or the maximum value.
11	0h RW	<b>RXTCPERRPIM:</b> MMC Receive TCP Error Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxtcp_err_pkts counter reaches half of the maximum value or the maximum value.
10	0h RW	<b>RXTCPGPIM:</b> MMC Receive TCP Good Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxtcp_gd_pkts counter reaches half of the maximum value or the maximum value.
9	0h RW	<b>RXUDPERPIM:</b> MMC Receive UDP Error Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxudp_err_pkts counter reaches half of the maximum value or the maximum value.
8	0h RW	<b>RXUDPGPIM:</b> MMC Receive UDP Good Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxudp_gd_pkts counter reaches half of the maximum value or the maximum value.
7	0h RW	<b>RXIPV6NOPAYPIM:</b> MMC Receive IPV6 No Payload Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv6_nopay_pkts counter reaches half of the maximum value or the maximum value.
6	0h RW	<b>RXIPV6HERPIM:</b> MMC Receive IPV6 Header Error Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv6_hdrerr_pkts counter reaches half of the maximum value or the maximum value.
5	0h RW	<b>RXIPV6GPIM:</b> MMC Receive IPV6 Good Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv6_gd_pkts counter reaches half of the maximum value or the maximum value.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	<b>RXIPV4UDSBLPIM:</b> MMC Receive IPV4 UDP Checksum Disabled Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_udsl_pkts counter reaches half of the maximum value or the maximum value.
3	0h RW	<b>RXIPV4FRAGPIM:</b> MMC Receive IPV4 Fragmented Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_frag_pkts counter reaches half of the maximum value or the maximum value.
2	0h RW	<b>RXIPV4NOPAYPIM:</b> MMC Receive IPV4 No Payload Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_nopay_pkts counter reaches half of the maximum value or the maximum value.
1	0h RW	<b>RXIPV4HERPIM:</b> MMC Receive IPV4 Header Error Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_herr_pkts counter reaches half of the maximum value or the maximum value.
0	0h RW	<b>RXIPV4GPIM:</b> MMC Receive IPV4 Good Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxipv4_gd_pkts counter reaches half of the maximum value or the maximum value.

#### 14.23.1.248MMC\_IPC\_RX\_INTERRUPT — Offset 50200808h

This register maintains the interrupt that the receive IPC statistic counters generate. The MMC Receive Checksum Offload Interrupt register maintains the interrupts generated when receive IPC statistic counters reach half their maximum values (0x8000\_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF\_FFFF for 32 bit counter and 0xFFFF for 16 bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC Receive Checksum Offload Interrupt register is 32 bit wide. When the MMC IPC counter that caused the interrupt is read, its corresponding interrupt bit is cleared. The counter's least-significant byte lane (Bits[7:0]) must be read to clear the interrupt bit.

Type	Size	Offset	Default
MMIO	32 bit	50200808h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXICMPERRPKT:</b> RxICMP Error Packets This field indicates the number of good IP datagrams received whose ICMP payload has a checksum error.

#### 14.23.1.263RXIPV4\_GOOD\_OCTETS – Offset 50200850h

This register provides the number of bytes received by DWC\_ether\_qos in good IPv4 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

Type	Size	Offset	Default
MMIO	32 bit	50200850h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXIPV4GDOCT:</b> RxIPv4 Good Octets This field indicates the number of bytes received in good IPv4 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

#### 14.23.1.264RXIPV4\_HEADER\_ERROR\_OCTETS – Offset 50200854h

This register provides the number of bytes received by DWC\_ether\_qos in IPv4 datagrams with header errors (checksum, length, version mismatch). The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

Type	Size	Offset	Default
MMIO	32 bit	50200854h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXIPV4HDRERROCT:</b> RxIPv4 Header Error Octets This field indicates the number of bytes received in IPv4 datagrams with header errors (checksum, length, version mismatch). The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

#### 14.23.1.265RXIPV4\_NO\_PAYLOAD\_OCTETS – Offset 50200858h

This register provides the number of bytes received by DWC\_ether\_qos in IPv4 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

Type	Size	Offset	Default
MMIO	32 bit	50200858h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXIPV4NOPAYOCT:</b> RxIPv4 Payload Octets This field indicates the number of bytes received in IPv4 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

#### 14.23.1.266RXIPV4\_FRAGMENTED\_OCTETS – Offset 5020085Ch

This register provides the number of bytes received by DWC\_ether\_qos in fragmented IPv4 datagrams. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

Type	Size	Offset	Default
MMIO	32 bit	5020085Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXIPV4FRAGOCT:</b> RxIPv4 Fragmented Octets This field indicates the number of bytes received in fragmented IPv4 datagrams. The value in the Length field of IPv4 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

#### 14.23.1.267RXIPV4\_UDP\_CHECKSUM\_DISABLE\_OCTETS – Offset 50200860h

This register provides the number of bytes received by DWC\_ether\_qos in a UDP segment that had the UDP checksum disabled. This counter does not count IP Header bytes. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

Type	Size	Offset	Default
MMIO	32 bit	50200860h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXIPV4UDSBLOCT:</b> RxIPv4 UDP Checksum Disable Octets This field indicates the number of bytes received in a UDP segment that had the UDP checksum disabled. This counter does not count IP Header bytes. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

#### 14.23.1.268RXIPV6\_GOOD\_OCTETS – Offset 50200864h

This register provides the number of bytes received by DWC\_ether\_qos in good IPv6 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

Type	Size	Offset	Default
MMIO	32 bit	50200864h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXIPV6GDOCT:</b> RxIPv6 Good Octets This field indicates the number of bytes received in good IPv6 datagrams encapsulating TCP, UDP, or ICMP data. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

#### 14.23.1.269RXIPV6\_HEADER\_ERROR\_OCTETS – Offset 50200868h

This register provides the number of bytes received by DWC\_ether\_qos in IPv6 datagrams with header errors (length, version mismatch). The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	50200868h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXIPV6HDRERROCT:</b> RxIPv6 Header Error Octets This field indicates the number of bytes received in IPv6 datagrams with header errors (length, version mismatch). The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

#### 14.23.1.270RXIPV6\_NO\_PAYLOAD\_OCTETS – Offset 5020086Ch

This register provides the number of bytes received by DWC\_ether\_qos in IPv6 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.

Type	Size	Offset	Default
MMIO	32 bit	5020086Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXIPV6NOPAYOCT:</b> RxIPv6 Payload Octets This field indicates the number of bytes received in IPv6 datagrams that did not have a TCP, UDP, or ICMP payload. The value in the Length field of IPv6 header is used to update this counter. (Ethernet header, FCS, pad, or IP pad bytes are not included in this counter.)

#### 14.23.1.271RXUDP\_GOOD\_OCTETS – Offset 50200870h

This register provides the number of bytes received by DWC\_ether\_qos in a good UDP segment. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	50200870h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXUDPGDOCT:</b> RxUDP Good Octets This field indicates the number of bytes received in a good UDP segment. This counter does not count IP header bytes.

#### 14.23.1.272RXUDP\_ERROR\_OCTETS – Offset 50200874h

This register provides the number of bytes received by DWC\_ether\_qos in a UDP segment that had checksum errors. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	50200874h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXUDPERROCT:</b> RxUDP Error Octets This field indicates the number of bytes received in a UDP segment that had checksum errors. This counter does not count IP header bytes.

#### 14.23.1.273RXTCP\_GOOD\_OCTETS – Offset 50200878h

This register provides the number of bytes received by DWC\_ether\_qos in a good TCP segment. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	50200878h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXTCPGDOCT:</b> RxTCP Good Octets This field indicates the number of bytes received in a good TCP segment. This counter does not count IP header bytes.

#### 14.23.1.274RXTCP\_ERROR\_OCTETS – Offset 5020087Ch

This register provides the number of bytes received by DWC\_ether\_qos in a TCP segment that had checksum errors. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	5020087Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXTCPEROCT:</b> RxTCP Error Octets This field indicates the number of bytes received in a TCP segment that had checksum errors. This counter does not count IP header bytes.

#### 14.23.1.275RXICMP\_GOOD\_OCTETS – Offset 50200880h

This register provides the number of bytes received by DWC\_ether\_qos in a good ICMP segment. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	50200880h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXICMPGDOCT:</b> RxICMP Good Octets This field indicates the number of bytes received in a good ICMP segment. This counter does not count IP header bytes.

#### 14.23.1.276RXICMP\_ERROR\_OCTETS – Offset 50200884h

This register provides the number of bytes received by DWC\_ether\_qos in a ICMP segment that had checksum errors. This counter does not count IP header bytes.

Type	Size	Offset	Default
MMIO	32 bit	50200884h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>RXICMPEROCT:</b> RxICMP Error Octets This field indicates the number of bytes received in a ICMP segment that had checksum errors. This counter does not count IP header bytes.

#### 14.23.1.277MMC\_FPE\_TX\_INTERRUPT – Offset 502008A0h

This register maintains the interrupts generated from all FPE related Transmit statistics counters. The MMC FPE Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000\_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF\_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC FPE Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Type	Size	Offset	Default
MMIO	32 bit	502008A0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RO/V	<b>HRCIS:</b> MMC Tx Hold Request Counter Interrupt Status This bit is set when the Tx_Hold_Req_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration.
0	0h RO/V	<b>FCIS:</b> MMC Tx FPE Fragment Counter Interrupt status This bit is set when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

### 14.23.1.278MMC\_FPE\_TX\_INTERRUPT\_MASK — Offset 502008A4h

This register maintains the masks for interrupts generated from all FPE related Transmit statistics counters. The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when FPE related receive statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

Type	Size	Offset	Default
MMIO	32 bit	502008A4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RW	<b>HRCIM:</b> MMC Transmit Hold Request Counter Interrupt Mask Setting this bit masks the interrupt when the Tx_Hold_Req_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration.
0	0h RW	<b>FCIM:</b> MMC Transmit Fragment Counter Interrupt Mask Setting this bit masks the interrupt when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

### 14.23.1.279MMC\_TX\_FPE\_FRAGMENT\_CNTR — Offset 502008A8h

This register provides the number of additional mPackets transmitted due to preemption.

Type	Size	Offset	Default
MMIO	32 bit	502008A8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXFFC:</b> Tx FPE Fragment counter This field indicates the number of additional mPackets that has been transmitted due to preemption Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

### 14.23.1.280MMC\_TX\_HOLD\_REQ\_CNTR — Offset 502008ACh

This register provides the count of number of times a hold request is given to MAC

Type	Size	Offset	Default
MMIO	32 bit	502008ACh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXHRC:</b> Tx Hold Request Counter This field indicates count of number of a hold request is given to MAC. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration.

### 14.23.1.281MMC\_FPE\_RX\_INTERRUPT — Offset 502008C0h

This register maintains the interrupts generated from all FPE related Receive statistics counters. The MMC FPE Receive Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000\_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF\_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC FPE Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Type	Size	Offset	Default
MMIO	32 bit	502008C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RO/V	<b>FCIS:</b> MMC Rx FPE Fragment Counter Interrupt Status This bit is set when the Rx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.
2	0h RO/V	<b>PAOCIS:</b> MMC Rx Packet Assembly OK Counter Interrupt Status This bit is set when the Rx_Packet_Assemble_Ok_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.
1	0h RO/V	<b>PSECIS:</b> MMC Rx Packet SMD Error Counter Interrupt Status This bit is set when the Rx_Packet_SMD_Err_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.
0	0h RO/V	<b>PAECIS:</b> MMC Rx Packet Assembly Error Counter Interrupt Status This bit is set when the Rx_Packet_Assemble_Err_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

#### 14.23.1.282MMC\_FPE\_RX\_INTERRUPT\_MASK – Offset 502008C4h

This register maintains the masks for interrupts generated from all FPE related Receive statistics counters. The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when FPE related receive statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

Type	Size	Offset	Default
MMIO	32 bit	502008C4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	<b>Reserved</b>
3	0h RW	<b>FCIM:</b> MMC Rx FPE Fragment Counter Interrupt Mask Setting this bit masks the interrupt when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.
2	0h RW	<b>PAOCIM:</b> MMC Rx Packet Assembly OK Counter Interrupt Mask Setting this bit masks the interrupt when the Rx_Packet_Assemble_Ok_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.
1	0h RW	<b>PSECIM:</b> MMC Rx Packet SMD Error Counter Interrupt Mask Setting this bit masks the interrupt when the R_Rx_Packet_SMD_Err_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.
0	0h RW	<b>PAECIM:</b> MMC Rx Packet Assembly Error Counter Interrupt Mask Setting this bit masks the interrupt when the R_Rx_Packet_Assemble_Err_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

#### 14.23.1.283MMC\_RX\_PACKET\_ASSEMBLY\_ERR\_CNTR – Offset 502008C8h

This register provides the number of MAC frames with reassembly errors on the Receiver, due to mismatch in the Fragment Count value.

Type	Size	Offset	Default
MMIO	32 bit	502008C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>PAEC:</b> Rx Packet Assembly Error Counter This field indicates the number of MAC frames with reassembly errors on the Receiver, due to mismatch in the Fragment Count value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

#### 14.23.1.284MMC\_RX\_PACKET\_SMD\_ERR\_CNTR — Offset 502008CCh

This register provides the number of received MAC frames rejected due to unknown SMD value and MAC frame fragments rejected due to arriving with an SMD-C when there was no preceding preempted frame.

Type	Size	Offset	Default
MMIO	32 bit	502008CCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>PSEC:</b> Rx Packet SMD Error Counter This field indicates the number of MAC frames rejected due to unknown SMD value and MAC frame fragments rejected due to arriving with an SMD-C when there was no preceding preempted frame. Exists when at least one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

#### 14.23.1.285MMC\_RX\_PACKET\_ASSEMBLY\_OK\_CNTR — Offset 502008D0h

This register provides the number of MAC frames that were successfully reassembled and delivered to MAC.

Type	Size	Offset	Default
MMIO	32 bit	502008D0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>PAOC:</b> Rx Packet Assembly OK Counter This field indicates the number of MAC frames that were successfully reassembled and delivered to MAC. Exists when at least one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

#### 14.23.1.286MMC\_RX\_FPE\_FRAGMENT\_CNTR — Offset 502008D4h

This register provides the number of additional mPackets received due to preemption.

Type	Size	Offset	Default
MMIO	32 bit	502008D4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>FFC:</b> Rx FPE Fragment Counter This field indicates the number of additional mPackets received due to preemption Exists when at least one of the RX/TX MMC counters are enabled during FPE Enabled configuration.

#### 14.23.1.287MAC\_L3\_L4\_CONTROL0 — Offset 50200900h

The Layer 3 and Layer 4 Control register controls the operations of filter 0 of Layer 3 and Layer 4.

Type	Size	Offset	Default
MMIO	32 bit	50200900h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	<b>Reserved</b>
28	0h RW	<b>DMCHENO:</b> DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter.
27	0h RO	<b>Reserved</b>
26:24	0h RW	<b>DMCHNO:</b> DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23:22	0h RO	<b>Reserved</b>
21	0h RW	<b>L4DPIMO:</b> Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4DPM0 bit is set high.
20	0h RW	<b>L4DPM0:</b> Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching.
19	0h RW	<b>L4SPIMO:</b> Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM0 bit is set high.
18	0h RW	<b>L4SPM0:</b> Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching.
17	0h RO	<b>Reserved</b>
16	0h RW	<b>L4PENO:</b> Layer 4 Protocol Enable When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching. The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set.

Bit Range	Default & Access	Field Name (ID): Description
15:11	00h RW	<b>L3HDBM0:</b> Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: - 0: No bits are masked. - 1: LSb[0] is masked. - 2: Two LSbs [1:0] are masked - .. - 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.
10:6	00h RW	<b>L3HSBM0:</b> Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5	0h RW	<b>L3DAIMO:</b> Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high.
4	0h RW	<b>L3DAM0:</b> Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PENO bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering.
3	0h RW	<b>L3SAIMO:</b> Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set.
2	0h RW	<b>L3SAM0:</b> Layer 3 IP SA Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching. Note: When the L3PENO bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering.
1	0h RO	<b>Reserved</b>
0	0h RW	<b>L3PENO:</b> Layer 3 Protocol Enable When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets. The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set.

#### 14.23.1.288MAC\_LAYER4\_ADDRESS0 — Offset 50200904h

The MAC\_Layer4\_Address(#i), MAC\_L3\_L4\_Control(#i), MAC\_Layer3\_Addr0\_Reg(#i), MAC\_Layer3\_Addr1\_Reg(#i), MAC\_Layer3\_Addr2\_Reg(#i) and MAC\_Layer3\_Addr3\_Reg(#i) registers are reserved (RO with default value) if Enable Layer 3 and Layer 4 Packet Filter option is not selected while configuring the core. You can configure the Layer 3 and Layer 4 Address Registers to be double-synchronized by selecting the Synchronize Layer 3 and Layer 4 Address Registers to Rx Clock Domain option while configuring the core. When you select this option, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian

mode) of the Layer 3 and Layer 4 Address Registers are written. For proper synchronization updates, you should perform consecutive writes to same Layer 3 and Layer 4 Address Registers after at least four clock cycles delay of the destination clock.

### 14.23.1.299MAC\_TIMESTAMP\_CONTROL — Offset 50200B00h

This register controls the operation of the System Time generator and processing of PTP packets for timestamping in the Receiver.

Type	Size	Offset	Default
MMIO	32 bit	50200B00h	00002000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	<b>Reserved</b>
28	0h RW	<b>AV8021ASMEN:</b> AV 802.1AS Mode Enable When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS mode of operation. When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit.
27:25	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	<b>TXTSSTM:</b> Transmit Timestamp Status Mode When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register.
23:21	0h RO	<b>Reserved</b>
20	0h RW	<b>ESTI:</b> External System Time Input When this bit is set, the MAC uses the external 64-bit reference System Time input for the following: - To take the timestamp provided as status - To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled. When this bit is reset, the MAC uses the internal reference System Time.
19	0h RW	<b>CSC:</b> Enable checksum correction during OST for PTP over UDP/IPv4 packets When this bit is set, the last two bytes of PTP message sent over UDP/IPv4 is updated to keep the UDP checksum correct, for changes made to origin timestamp and/or correction field as part of one step timestamp operation. The application shall form the packet with these two dummy bytes. When reset, no updates are done to keep the UDP checksum correct. The application shall form the packet with UDP checksum set to 0.
18	0h RW	<b>TSENMACADDR:</b> Enable MAC Address for PTP Packet Filtering When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet. For normal time stamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching. For PTP offload, only MAC address register 0 is considered for unicast destination address matching.
17:16	0h RW	<b>SNAPTYPSEL:</b> Select PTP packets for Taking Snapshots These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. The encoding is given in Timestamp Snapshot Dependency on Register Bits Table.
15	0h RW	<b>TSMSTRENA:</b> Enable Snapshot for Messages Relevant to Master When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node.
14	0h RW	<b>TSEVNTENA:</b> Enable Timestamp Snapshot for Event Messages When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see Timestamp Snapshot Dependency on Register Bits Table.
13	1h RW	<b>TSIPV4ENA:</b> Enable Processing of PTP Packets Sent over IPv4-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default.
12	0h RW	<b>TSIPV6ENA:</b> Enable Processing of PTP Packets Sent over IPv6-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	<b>TSIPENA:</b> Enable Processing of PTP over Ethernet Packets When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets.
10	0h RW	<b>TSVER2ENA:</b> Enable PTP Packet Processing for Version 2 Format When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'.
9	0h RW	<b>TSCTRLSSR:</b> Timestamp Digital or Binary Rollover Control When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit.
8	0h RW	<b>TSENALL:</b> Enable Timestamp for All Packets When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC.
7	0h RO	<b>Reserved</b>
6	0h RW	<b>PTGE:</b> Presentation Time Generation Enable When this bit is set the Presentation Time generation is enabled.
5	0h RW	<b>TSADDREG:</b> Update Addend Register When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
4	0h RO	<b>Reserved</b>
3	0h RW	<b>TSUPDT:</b> Update Timestamp When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before updating it. This bit is reset when the update is complete in hardware. The Timestamp Higher Word register (if enabled during core configuration) is not updated. When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	<b>TSINIT:</b> Initialize Timestamp When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before it is updated. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled during core configuration) can only be initialized. When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
1	0h RW	<b>TSCFUPDT:</b> Fine or Coarse Timestamp Update When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp.
0	0h RW	<b>TSENA:</b> Enable Timestamp When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode. On the Receive side, the MAC processes the 1588 packets only if this bit is set.

#### 14.23.1.300MAC\_SUB\_SECOND\_INCREMENT — Offset 50200B04h

This register specifies the value to be added to the internal system time register every cycle of clk\_ptp\_ref\_i clock.

Type	Size	Offset	Default
MMIO	32 bit	50200B04h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:16	00h RW	<b>SSINC:</b> Sub-second Increment Value The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [Bit 9 (TSCTRLSSR) is set in MAC_Timestamp_Control]. When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.
15:8	00h RW	<b>SNSINC:</b> Sub-nanosecond Increment Value This field contains the sub-nanosecond increment value, represented in nanoseconds multiplied by $2^8$ . This value is accumulated with the sub-nanoseconds field of the subsecond register. For example, when TSCTRLSSR field in the MAC_Timestamp_Control register is set, and if the required increment is 5.3ns, then SSINC should be 0x05 and SNSINC should be 0x4C.
7:0	0h RO	<b>Reserved</b>

### 14.23.1.301MAC\_SYSTEM\_TIME\_SECONDS – Offset 50200B08h

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from clk\_ptp\_ref\_i to CSR clock).

Type	Size	Offset	Default
MMIO	32 bit	50200B08h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TSS:</b> Timestamp Second The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

### 14.23.1.302MAC\_SYSTEM\_TIME\_NANOSECONDS – Offset 50200B0Ch

The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC.

Type	Size	Offset	Default
MMIO	32 bit	50200B0Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved</b>
30:0	00000000h RO/V	<b>TSSS:</b> Timestamp Sub Seconds The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When Bit 9 is set in MAC_Timestamp_Control, each bit represents 1 ns. The maximum value is 0x3B9A_C9FF after which it rolls-over to zero.

### 14.23.1.303MAC\_SYSTEM\_TIME\_SECONDS\_UPDATE – Offset 50200B10h

The System Time Seconds Update register, along with the System Time Nanoseconds Update register, initializes or updates the system time maintained by the MAC. You must write both registers before setting the TSINIT or TSUPDT bits in DWC\_eqos\_top\_map/EQOS\_MAC/MAC\_Timestamp\_Control.

Type	Size	Offset	Default
MMIO	32 bit	50200B10h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TSS:</b> Timestamp Seconds The value in this field is the seconds part of the update. When ADDSUB is reset, this field must be programmed with the seconds part of the update value. When ADDSUB is set, this field must be programmed with the complement of the seconds part of the update value. For example, if 2.000000001 seconds need to be subtracted from the system time, the TSS field in the MAC_Timestamp_Seconds_Update register must be 0xFFFF_FFFE (that is, $2^{32} - 2$ ).

#### 14.23.1.304MAC\_SYSTEM\_TIME\_NANOSECONDS\_UPDATE – Offset 50200B14h

MAC System Time Nanoseconds Update register.

Type	Size	Offset	Default
MMIO	32 bit	50200B14h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>ADDSUB:</b> Add or Subtract Time When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register.
30:0	00000000h RW	<b>TSSS:</b> Timestamp Sub Seconds The value in this field is the sub-seconds part of the update. When ADDSUB is reset, this field must be programmed with the sub-seconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the MAC_Timestamp_Control register. When ADDSUB is set, this field must be programmed with the complement of the sub-seconds part of the update value as described below. When TSCTRLSSR bit in MAC_Timestamp_Control is set, the programmed value must be $10^9 - 1$ . When TSCTRLSSR bit in MAC_Timestamp_Control is reset, the programmed value must be $2^{31} - 1$ . When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, each bit represents an accuracy of 0.46 ns. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF. For example, if 2.000000001 seconds need to be subtracted from the system time, then the TSSS field in the MAC_Timestamp_Nanoseconds_Update register must be 0x7FFF_FFFF (that is, $2^{31} - 1$ ), when TSCTRLSSR bit in MAC_Timestamp_Control is reset and 0x3B9A_C9FF (that is, $10^9 - 1$ ), when TSCTRLSSR bit in MAC_Timestamp_Control is set.

### 14.23.1.305MAC\_TIMESTAMP\_ADDEND — Offset 50200B18h

Timestamp Addend register. This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the MAC\_Timestamp\_Control register). The content of this register is added to a 32-bit accumulator in every clock cycle (of clk\_ptp\_ref\_i) and the system time is updated whenever the accumulator overflows.

Type	Size	Offset	Default
MMIO	32 bit	50200B18h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TSAR:</b> Timestamp Addend Register This field indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

### 14.23.1.306MAC\_SYSTEM\_TIME\_HIGHER\_WORD\_SECONDS — Offset 50200B1Ch

System Time - Higher Word Seconds register.

Type	Size	Offset	Default
MMIO	32 bit	50200B1Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>TSHWR:</b> Timestamp Higher Word Register This field contains the most-significant 16-bits of timestamp seconds value. This register is optional. You can add this register by selecting the Add IEEE 1588 Higher Word Register option. This register is directly written to initialize the value and it is incremented when there is an overflow from 32-bits of the System Time Seconds register. Access restriction applies. Updated based on the event. Setting 1 sets. Setting 0 clears.

### 14.23.1.307MAC\_TIMESTAMP\_STATUS — Offset 50200B20h

Timestamp Status register. All bits except Bits[27:25] gets cleared when the application reads this register.

Type	Size	Offset	Default
MMIO	32 bit	50200B20h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	<b>Reserved</b>
29:25	00h RO/V	<b>ATSNS:</b> Number of Auxiliary Timestamp Snapshots This field indicates the number of Snapshots available in the FIFO. A value equal to the selected depth of FIFO (4, 8, or 16) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.
24	0h RO/V	<b>ATSSTM:</b> Auxiliary Timestamp Snapshot Trigger Missed This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected.
23:20	0h RO	<b>Reserved</b>
19:16	0h RO/V	<b>ATSSTN:</b> Auxiliary Timestamp Snapshot Trigger Identifier These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list: - Bit 16: Auxiliary trigger 0 - Bit 17: Auxiliary trigger 1 - Bit 18: Auxiliary trigger 2 - Bit 19: Auxiliary trigger 3 The software can read this register to find the triggers that are set when the timestamp is taken. Access restriction applies. Clears on read. Self-set to 1 on internal event.
15	0h RO/V	<b>TXTSSIS:</b> Tx Timestamp Status Interrupt Status In non-EQOS_CORE configurations when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers. When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and MAC_Tx_Timestamp_Status_Seconds registers, for PTO generated Delay Request and Pdelay request packets. This bit is cleared when the MAC_Tx_Timestamp_Status_Seconds register is read (or write to MAC_Tx_Timestamp_Status_Seconds register when RCWE bit of MAC_CSR_SW_Ctrl register is set).
14:6	0h RO	<b>Reserved</b>
5	0h RO/V	<b>TSTRGTER1:</b> Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	<b>TSTARGT1:</b> Timestamp Target Time Reached for Target Time PPS1 When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
3	0h RO/V	<b>TSTRGTERRO:</b> Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
2	0h RO/V	<b>AUXTSTRIG:</b> Auxiliary Timestamp Trigger Snapshot This bit is set high when the auxiliary snapshot is written to the FIFO. This bit is valid only if the Add IEEE 1588 Auxiliary Snapshot option is selected. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
1	0h RO/V	<b>TSTARGT0:</b> Timestamp Target Time Reached When set, this bit indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.
0	0h RO/V	<b>TSSOVF:</b> Timestamp Seconds Overflow When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event.

#### 14.23.1.308MAC\_TX\_TIMESTAMP\_STATUS\_NANOSECONDS — Offset 50200B30h

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled. The MAC\_Tx\_Timestamp\_Status\_Nanoseconds register, along with MAC\_Tx\_Timestamp\_Status\_Seconds, gives the 64-bit timestamp captured for the PTP packet successfully transmitted by the MAC. This value is considered to be read by the application when the last byte of MAC\_Tx\_Timestamp\_Status\_Nanoseconds is read. In the little-endian mode, this means when bits[31:24] are read; in big-endian mode, bits[7:0] are read. If the application does not read these registers and timestamp of another packet is captured, then either the current timestamp is lost (overwritten) or the new timestamp is lost (dropped), depending on the setting of the TXTSSTSM bit of the MAC\_Timestamp\_Control register. The status bit TXTSC bit [15] in MAC\_Timestamp\_Status register is set whenever the MAC transmitter captures the timestamp.

Type	Size	Offset	Default
MMIO	32 bit	50200B30h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	<b>TXTSSMIS:</b> Transmit Timestamp Status Missed When this bit is set, it indicates one of the following: - The timestamp of the current packet is ignored if TXTSSTM bit of the MAC_Timestamp_Control register is reset - The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTM bit of the MAC_Timestamp_Control register is set. Access restriction applies. Clears on read. Self-set to 1 on internal event.
30:0	00000000h RO/V	<b>TXTSSLO:</b> Transmit Timestamp Status Low This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

#### 14.23.1.309MAC\_TX\_TIMESTAMP\_STATUS\_SECONDS – Offset 50200B34h

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

Type	Size	Offset	Default
MMIO	32 bit	50200B34h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>TXTSSH:</b> Transmit Timestamp Status High This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

#### 14.23.1.310MAC\_AUXILIARY\_CONTROL – Offset 50200B40h

The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot.

Type	Size	Offset	Default
MMIO	32 bit	50200B40h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW	<b>ATSEN1:</b> Auxiliary Snapshot 1 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 1. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[1] input is enabled. When this bit is reset, the events on this input are ignored.
4	0h RW	<b>ATSENO:</b> Auxiliary Snapshot 0 Enable This bit controls the capturing of Auxiliary Snapshot Trigger 0. When this bit is set, the auxiliary snapshot of the event on ptp_aux_trig_i[0] input is enabled. When this bit is reset, the events on this input are ignored.
3:1	0h RO	<b>Reserved</b>
0	0h RW	<b>ATSFC:</b> Auxiliary Snapshot FIFO Clear When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

#### 14.23.1.311 MAC\_AUXILIARY\_TIMESTAMP\_NANOSECONDS – Offset 50200B48h

The Auxiliary Timestamp Nanoseconds register, along with MAC\_Auxiliary\_Timestamp\_Seconds, gives the 64-bit timestamp stored as auxiliary snapshot. These two registers form the read port of a 64-bit wide FIFO with a depth of 4, 8, or 16 as selected while configuring the core. You can store multiple snapshots in this FIFO. Bits[29:25] in MAC\_Timestamp\_Status indicate the fill-level of the FIFO. The top of the FIFO is removed only when the last byte of MAC\_Auxiliary\_Timestamp\_Seconds register is read. In the little-endian mode, this means when Bits[31:24] are read and in big-endian mode, Bits[7:0] are read.

Type	Size	Offset	Default
MMIO	32 bit	50200B48h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	<b>Reserved</b>
30:0	00000000h RO/V	<b>AUXTSLO:</b> Auxiliary Timestamp Contains the lower 31 bits (nanoseconds field) of the auxiliary timestamp.

#### 14.23.1.312MAC\_AUXILIARY\_TIMESTAMP\_SECONDS — Offset 50200B4Ch

The Auxiliary Timestamp - Seconds register contains the lower 32 bits of the Seconds field of the auxiliary timestamp register.

Type	Size	Offset	Default
MMIO	32 bit	50200B4Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>AUXTSHI:</b> Auxiliary Timestamp Contains the lower 32 bits of the Seconds field of the auxiliary timestamp.

#### 14.23.1.313MAC\_TIMESTAMP\_INGRESS\_ASYM\_CORR — Offset 50200B50h

The MAC Timestamp Ingress Asymmetry Correction register contains the Ingress Asymmetry Correction value to be used while updating correction field in PDelay\_Resp PTP messages.

Type	Size	Offset	Default
MMIO	32 bit	50200B50h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>OSTIAC:</b> One-Step Timestamp Ingress Asymmetry Correction This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by $2^{16}$ . For example, 2.5 ns is represented as 0x00028000. The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

#### 14.23.1.314MAC\_TIMESTAMP\_EGRESS\_ASYM\_CORR — Offset 50200B54h

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay\_Req PTP messages.

Type	Size	Offset	Default
MMIO	32 bit	50200B54h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>OSTEAC:</b> One-Step Timestamp Egress Asymmetry Correction This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by $2^{16}$ . For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFF_8000, which is the 2's complement of 0x0002_8000( $2.5 * 2^{16}$ ). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003_4CCC (3.3 * $2^{16}$ ).

#### 14.23.1.315MAC\_TIMESTAMP\_INGRESS\_CORR\_NANOSECOND — Offset 50200B58h

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

Type	Size	Offset	Default
MMIO	32 bit	50200B58h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TSIC:</b> Timestamp Ingress Correction This field contains the ingress path correction value as defined by the Ingress Correction expression.

#### 14.23.1.316MAC\_TIMESTAMP\_EGRESS\_CORR\_NANOSECOND — Offset 50200B5Ch

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the egress path.

Type	Size	Offset	Default
MMIO	32 bit	50200B5Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access

14:13	0h RW	<b>TRGTMODSEL1:</b> Target Time Register Mode for PPS1 Output This field indicates the Target Time registers (MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds) mode for PPS1 output signal.
12	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RW	<b>PPSCMD1:</b> Flexible PPS1 Output Control This field controls the flexible PPS1 output (ptp_pps_o[1]) signal. This field is similar to the PPSCMD0 field. If MCGREN1 is set, then PPSCMD1 indicated by these 4 bits [11:8] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 1. This field is similar to the PPSCMD0 Presentation Time Control bits. If MCGREN1 is not set then only 3 bits from [10:8] is used as PPSCMD1 and the 4th bit is to be set as 0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
7	0h RW	<b>MCGRENO:</b> MCGR Mode Enable for PPS0 Output This field enables the 0th PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode.

Bit Range	Default & Access	Field Name (ID): Description
6:5	0h RW	<b>TRGTMODSEL0:</b> Target Time Register Mode for PPS0 Output This field indicates the Target Time registers (MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds) mode for PPS0 output signal:
4	0h RW	<b>PPSEN0:</b> Flexible PPS Output Mode Enable When this bit is set, Bits[3:0] function as PPSCMD. When this bit is reset, Bits[3:0] function as PPSCTRL (Fixed PPS mode).
3:0	0h RW	<b>PPSCTRL_PPSCMD:</b> PPS Output Frequency Control This field controls the frequency of the PPS0 output (ptp_pps_o[0]) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies: - 0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz. - 0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz. - 0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz. - 0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz. - ... - 1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz. Note: In the binary rollover mode, the PPS output (ptp_pps_o) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example: - When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms - When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period Second clock of 463 ms period (268 ms low and 195 ms high) - When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period Fourth clock of 195 ms period (134 ms low and 61 ms high) This behavior is because of the non-linear toggling of bits in the digital rollover mode in the MAC_System_Time_Nanoseconds register. or Flexible PPS Output (ptp_pps_o[0]) Control Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all-zero'. The following list describes the values of PPSCMD0: - 0000: No Command - 0001: START Single Pulse This command generates single pulse rising at the start point defined in MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds register and of a duration defined in the PPS0 Width Register. - 0010: START Pulse Train This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS0 Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands. - 0011: Cancel START This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time. - 0100: STOP Pulse train at time This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010) after the time programmed in the Target Time registers elapses. - 0101: STOP Pulse Train immediately This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010). - 110: Cancel STOP Pulse train This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command. - 0111-1111: Reserved or Presentation Time Control If MCGRENO is set then these bits are treated as Presentation time control bits. The following list describes the values of PPSCMD0: - 0000: MCGR operation is not carried out. If set to this value in the mid of clock recovery or generation, all the processing inputs are flushed - 0001: Capture the Presentation time at the rising edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0010: Capture the Presentation time at the falling edge of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0011: Capture the Presentation time at both edges of mcg_pst_trig_i[0] into the MAC_PPS0_Target_Time_Seconds register - 0100-1000: Reserved - 1001: Toggle output on compare - 1010: Pulse output low on compare for one PTP-clock cycle - 1011: Pulse output high on compare for one PTP-clock cycle - 1100-1111: Reserved

### 14.23.1.322MAC\_PPS0\_TARGET\_TIME\_SECONDS — Offset 50200B80h

The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC\_Timestamp\_Status] when the system time exceeds the value programmed in these registers.

Type	Size	Offset	Default
MMIO	32 bit	50200B80h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>TSTRHO:</b> PPS Target Time Seconds Register This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the MAC_PPS_Control register. If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and PTGE field of MAC_Timestamp_Control Register is set with Presentation time control set in recovery mode, then these bits indicate the TPT being programmed by the application and in generation mode it indicates the CPT generated at the sampled trigger.

### 14.23.1.323MAC\_PPS0\_TARGET\_TIME\_NANOSECONDS — Offset 50200B84h

PPS0 Target Time Nanoseconds register.

Type	Size	Offset	Default
MMIO	32 bit	50200B84h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>TRGBTBUSY0:</b> PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_Control register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain. The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted.
30:0	00000000h RW	<b>TTSLO:</b> Target Time Low for PPS Register This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in MAC_PPS_Control. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

#### 14.23.1.324MAC\_PPS0\_INTERVAL – Offset 50200B88h

The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output (ptp\_pps\_o[0]).

Type	Size	Offset	Default
MMIO	32 bit	50200B88h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>PPSINTO:</b> PPS Output Signal Interval These bits store the interval between the rising edges of PPS0 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS0 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

### 14.23.1.325MAC\_PPS0\_WIDTH — Offset 50200B8Ch

The PPS0 Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS0 signal output (ptp\_pps\_o[0]).

Type	Size	Offset	Default
MMIO	32 bit	50200B8Ch	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	0000000h RW	<b>PPSWIDTH0:</b> PPS Output Signal Width These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

### 14.23.1.326MAC\_PPS1\_TARGET\_TIME\_SECONDS — Offset 50200B90h

The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC\_Timestamp\_Status] when the system time exceeds the value programmed in these registers.

Type	Size	Offset	Default
MMIO	32 bit	50200B90h	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	0000000h RW	<b>TSTRH1:</b> PPS Target Time Seconds Register This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the MAC_PPS_Control register. If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and PTGE field of MAC_Timestamp_Control Register is set with Presentation time control set in recovery mode, then these bits indicate the TPT being programmed by the application and in generation mode it indicates the CPT generated at the sampled trigger.

### 14.23.1.327MAC\_PPS1\_TARGET\_TIME\_NANOSECONDS – Offset 50200B94h

PPS0 Target Time Nanoseconds register.

Type	Size	Offset	Default
MMIO	32 bit	50200B94h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>TRGTBUSY1:</b> PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_Control register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain. The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted.
30:0	00000000h RW	<b>TTS1:</b> Target Time Low for PPS Register This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in MAC_PPS_Control. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

### 14.23.1.328MAC\_PPS1\_INTERVAL – Offset 50200B98h

The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output (ptp\_pps\_o[0]).

Type	Size	Offset	Default
MMIO	32 bit	50200B98h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>PPSINT1:</b> PPS Output Signal Interval These bits store the interval between the rising edges of PPS0 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS0 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

#### 14.23.1.329MAC\_PPS1\_WIDTH — Offset 50200B9Ch

The PPS0 Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS0 signal output (ptp\_pps\_o[0]).

Type	Size	Offset	Default
MMIO	32 bit	50200B9Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>PPSWIDTH1:</b> PPS Output Signal Width These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

#### 14.23.1.330MAC\_PTO\_CONTROL — Offset 50200BC0h

This register controls the PTP Offload Engine operation. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	50200BC0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:8	00h RW	<b>DN:</b> Domain Number This field indicates the domain Number in which the PTP node is operating.
7	0h RW	<b>PDRDIS:</b> Disable Peer Delay Response response generation When this bit is set, the Peer Delay Response (Pdelay_Resp) response is not be generated for received Peer Delay Request (Pdelay_Req) request packet, as required by the programmed mode. Note: Setting this bit to 1 affects the normal PTP Offload operation and the time synchronization. So, this bit must be set only if there is problem with Pdelay_Resp generation in Hardware and/or Pdelay_Resp generation is handled by Software.
6	0h RW	<b>DRRDIS:</b> Disable PTO Delay Request/Response response generation When this bit is set, the Delay Request and Delay response is not generated for received SYNC and Delay request packet respectively, as required by the programmed mode.
5	0h RW	<b>APDREQTRIG:</b> Automatic PTP Pdelay_Req message Trigger When this bit is set, one PTP Pdelay_Req message is transmitted. This bit is automatically cleared after the PTP Pdelay_Req message is transmitted. The application should set the APDREQEN bit for this operation. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
4	0h RW	<b>ASYNCTRIG:</b> Automatic PTP SYNC message Trigger When this bit is set, one PTP SYNC message is transmitted. This bit is automatically cleared after the PTP SYNC message is transmitted. The application should set the ASYNCEN bit for this operation. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
3	0h RO	<b>Reserved</b>
2	0h RW	<b>APDREQEN:</b> Automatic PTP Pdelay_Req message Enable When this bit is set, PTP Pdelay_Req message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Peer-to-Peer Transparent mode.
1	0h RW	<b>ASYNCEN:</b> Automatic PTP SYNC message Enable When this bit is set, PTP SYNC message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Clock Master mode.
0	0h RW	<b>PTOPEN:</b> PTP Offload Enable When this bit is set, the PTP Offload feature is enabled.

#### 14.23.1.331MAC\_SOURCE\_PORT\_IDENTITY0 – Offset 50200BC4h

This register contains Bits[31:0] of the 80-bit Source Port Identity of the PTP node. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	50200BC4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>SPI0:</b> Source Port Identity 0 This field indicates bits [31:0] of sourcePortIdentity of PTP node.

#### 14.23.1.332MAC\_SOURCE\_PORT\_IDENTITY1 – Offset 50200BC8h

This register contains Bits[63:32] of the 80-bit Source Port Identity of the PTP node.  
This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	50200BC8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>SPI1:</b> Source Port Identity 1 This field indicates bits [63:32] of sourcePortIdentity of PTP node.

#### 14.23.1.333MAC\_SOURCE\_PORT\_IDENTITY2 – Offset 50200BCCh

This register contains Bits[79:64] of the 80-bit Source Port Identity of the PTP node.  
This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	50200BCCh	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15:0	0000h RW	<b>SPI2:</b> Source Port Identity 2 This field indicates bits [79:64] of sourcePortIdentity of PTP node.

#### 14.23.1.334MAC\_LOG\_MESSAGE\_INTERVAL — Offset 50200BD0h

This register contains the periodic intervals for automatic PTP packet generation. This register is available only when the Enable PTP Timestamp Offload feature is selected.

Type	Size	Offset	Default
MMIO	32 bit	50200BD0h	0000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	<b>LMPDRI:</b> Log Min Pdelay_Req Interval This field indicates logMinPdelayReqInterval of PTP node. This is used to schedule the periodic Pdelay request packet transmission. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

Bit Range	Default & Access	Field Name (ID): Description
23:11	0h RO	<b>Reserved</b>
10:8	0h RW	<b>DRSYNCR:</b> Delay_Req to SYNC Ratio In Slave mode, it is used for controlling frequency of Delay_Req messages transmitted. - 0: DelayReq generated for every received SYNC - 1: DelayReq generated every alternate reception of SYNC - 2: for every 4 SYNC messages - 3: for every 8 SYNC messages - 4: for every 16 SYNC messages - 5: for every 32 SYNC messages - 6-7: Reserved The master sends this information (logMinDelayReqInterval) in the DelayResp PTP messages to the slave. The DWC_ether_qos Receiver processes this value from the received DelayResp messages and updates this field accordingly. In the Slave mode, the host must not write/update this register unless it has to override the received value. In Master mode, the sum of this field and logSyncInterval (LSI) field is provided in the logMinDelayReqInterval field of the generated multicast Delay_Resp PTP message. Access restriction applies. Updated based on the event. Setting 1 sets. Setting 0 clears.
7:0	00h RW	<b>LSI:</b> Log Sync Interval This field indicates the periodicity of the automatically generated SYNC message when the PTP node is Master. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

#### 14.23.1.335MTL\_OPERATION\_MODE — Offset 50200C00h

The Operation Mode register establishes the Transmit and Receive operating modes and commands.

Type	Size	Offset	Default
MMIO	32 bit	50200C00h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	<b>Reserved</b>
15	0h RW	<b>FRPE:</b> Flexible Rx parser Enable When this bit is set to 1, the Programmable Rx Parser functionality is enabled. When the Rx parser is disabled and if the Rx parser is in the middle of the parsing then it gets disabled only after completing the current packet parsing. When the Rx parser is enabled from disabled state then the Rx parser gets activated for the next immediate packet.
14	0h RW	<b>RXPED:</b>
13:10	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	<b>CNTCLR:</b> Counters Reset When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. If this bit is set along with CNT_PRESET bit, CNT_PRESET has precedence. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
8	0h RW	<b>CNTPRST:</b> Counters Preset When this bit is set, - MTL_TxQ[0-7]_Underflow register is initialized/preset to 12'h7F0. - Missed Packet and Overflow Packet counters in MTL_RxQ[0-7]_Missed_Packet_Overflow_Cnt register is initialized/preset to 12'h7F0. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>SCHALG:</b> Tx Scheduling Algorithm This field indicates the algorithm for Tx scheduling:
4:3	0h RO	<b>Reserved</b>
2	0h RW	<b>RAA:</b> Receive Arbitration Algorithm This field is used to select the arbitration algorithm for the Rx side. - 0: Strict priority (SP) Queue 0 has the lowest priority and the last queue has the highest priority. - 1: Weighted Strict Priority (WSP)
1	0h RW	<b>DTXSTS:</b> Drop Transmit Status When this bit is set, the Tx packet status received from the MAC is dropped in the MTL. When this bit is reset, the Tx packet status received from the MAC is forwarded to the application.
0	0h RO	<b>Reserved</b>

#### 14.23.1.336MTL\_DBG\_CTL – Offset 50200C08h

The FIFO Debug Access Control and Status register controls the operation mode of FIFO debug access.

Type	Size	Offset	Default
MMIO	32 bit	50200C08h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	<b>Reserved</b>
18:17	0h RW	<b>EIEC:</b> ECC Inject Error Control for Tx, Rx and TSO memories When EIEC bit of this register is set, following are the errors inserted based on the value encoded in this field.
16	0h RW	<b>EIEE:</b> ECC Inject Error Enable for Tx, Rx and TSO memories When set, enables the ECC error injection feature. When reset, disables the ECC error injection feature.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	<b>STSIE:</b> Transmit Status Available Interrupt Status Enable When this bit is set, an interrupt is generated when Transmit status is available in slave mode.
14	0h RW	<b>PKTIE:</b> Receive Packet Available Interrupt Status Enable When this bit is set, an interrupt is generated when EOP of received packet is written to the Rx FIFO.
13:12	0h RW	<b>FIFOSEL:</b> FIFO Selected for Access This field indicates the FIFO selected for debug access:
11	0h RW	<b>FIFOWREN:</b> FIFO Write Enable When this bit is set, it enables the Write operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets.
10	0h RW	<b>FIFORDEN:</b> FIFO Read Enable When this bit is set, it enables the Read operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets.
9	0h RW	<b>RSTSEL:</b> Reset Pointers of Selected FIFO When this bit is set, the pointers of the currently-selected FIFO are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets.
8	0h RW	<b>RSTALL:</b> Reset All Pointers When this bit is set, the pointers of all FIFOs are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets.
7	0h RO	<b>Reserved</b>
6:5	0h RW	<b>PKTSTATE:</b> Encoded Packet State This field is used to write the control information to the Tx FIFO or Rx FIFO. Tx FIFO: - 00: Packet Data - 01: Control Word - 10: SOP Data - 11: EOP Data Rx FIFO: - 00: Packet Data - 01: Normal Status - 10: Last Status - 11: EOP
4	0h RO	<b>Reserved</b>
3:2	0h RW	<b>BYTEEN:</b> Byte Enables This field indicates the number of data bytes valid in the data register during Write operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected.
1	0h RW	<b>DBGMOD:</b> Debug Mode Access to FIFO When this bit is set, it indicates that the current access to the FIFO is read, write, and debug access. In this mode, the following access types are allowed: - Read and Write access to Tx FIFO, TSO FIFO, and Rx FIFO - Read access is allowed to Tx Status FIFO. When this bit is reset, it indicates that the current access to the FIFO is slave access bypassing the DMA. In this mode, the following access are allowed: - Write access to the Tx FIFO - Read access to the Rx FIFO and Tx Status FIFO
0	0h RW	<b>FDBGGEN:</b> FIFO Debug Access Enable When this bit is set, it indicates that the debug mode access to the FIFO is enabled. When this bit is reset, it indicates that the FIFO can be accessed only through a master interface.

### 14.23.1.337MTL\_DBG\_STS – Offset 50200C0Ch

The FIFO Debug Status register contains the status of FIFO debug access.

Type	Size	Offset	Default
MMIO	32 bit	50200C0Ch	00000018h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:15	00000h RO/V	<b>LOCR:</b> Remaining Locations in the FIFO Slave Access Mode: This field indicates the space available in selected FIFO. Debug Access Mode: This field contains the Write or Read pointer value of the selected FIFO during Write or Read operation, respectively. Reset: In single Tx Queue configurations, (DWC_EQOS_TXFIFO_SIZE/(DWC_EQOS_DATAWIDTH/8)), Otherwise 0000H
14:10	0h RO	<b>Reserved</b>
9	0h RW	<b>STSI:</b> Transmit Status Available Interrupt Status When set, this bit indicates that the Slave mode Tx packet is transmitted, and the status is available in Tx Status FIFO. This bit is reset when 1 is written to this bit.
8	0h RW	<b>PKTI:</b> Receive Packet Available Interrupt Status When set, this bit indicates that MAC layer has written the EOP of received packet to the Rx FIFO. This bit is reset when 1 is written to this bit.
7:5	0h RO	<b>Reserved</b>
4:3	3h RO/V	<b>BYTEEN:</b> Byte Enables This field indicates the number of data bytes valid in the data register during Read operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected.
2:1	0h RO/V	<b>PKTSTATE:</b> Encoded Packet State This field is used to get the control or status information of the selected FIFO. Tx FIFO: - 00: Packet Data - 01: Control Word - 10: SOP Data - 11: EOP Data Rx FIFO: - 00: Packet Data - 01: Normal Status - 10: Last Status - 11: EOP This field is applicable only for Tx FIFO and Rx FIFO during Read operation.
0	0h RO/V	<b>FIFOBUSY:</b> FIFO Busy When set, this bit indicates that a FIFO operation is in progress in the MAC and content of the following fields is not valid: - All other fields of this register - All fields of the MTL_FIFO_Debug_Data register

### 14.23.1.338MTL\_FIFO\_DEBUG\_DATA – Offset 50200C10h

The FIFO Debug Data register contains the data to be written to or read from the FIFOs.

Type	Size	Offset	Default
MMIO	32 bit	50200C10h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>FDBGDATA:</b> FIFO Debug Data During debug or slave access write operation, this field contains the data to be written to the Tx FIFO, Rx FIFO, or TSO FIFO. During debug or slave access read operation, this field contains the data read from the Tx FIFO, Rx FIFO, TSO FIFO, or Tx Status FIFO.

#### 14.23.1.339 MTL\_INTERRUPT\_STATUS – Offset 50200C20h

The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC.

Type	Size	Offset	Default
MMIO	32 bit	50200C20h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23	0h RO/V	<b>MTLPIS:</b> MTL Rx Parser Interrupt Status This bit indicates that there is an interrupt from Rx Parser Block. To reset this bit, the application must read the MTL_Rxp_Interrupt_Status register to get the exact cause of the interrupt and clear its source.
22:19	0h RO	<b>Reserved</b>
18	0h RO/V	<b>ESTIS:</b> EST (TAS- 802.1Qbv) Interrupt Status This bit indicates an interrupt event during the operation of 802.1Qbv. To reset this bit, the application must clear the error/event that has caused the Interrupt.
17	0h RO/V	<b>DBGIS:</b> Debug Interrupt status This bit indicates an interrupt event during the slave access. To reset this bit, the application must read the FIFO Debug Access Status register to get the exact cause of the interrupt and clear its source.
16:8	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO/V	<b>Q7IS:</b> Queue 7 Interrupt status This bit indicates that there is an interrupt from Queue 7. To reset this bit, the application must read the MTL_Q7_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source.
6	0h RO/V	<b>Q6IS:</b> Queue 6 Interrupt status This bit indicates that there is an interrupt from Queue 6. To reset this bit, the application must read the MTL_Q6_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source.
5	0h RO/V	<b>Q5IS:</b> Queue 5 Interrupt status This bit indicates that there is an interrupt from Queue 5. To reset this bit, the application must read the MTL_Q5_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source.
4	0h RO/V	<b>Q4IS:</b> Queue 4 Interrupt status This bit indicates that there is an interrupt from Queue 4. To reset this bit, the application must read the MTL_Q4_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source.
3	0h RO/V	<b>Q3IS:</b> Queue 3 Interrupt status This bit indicates that there is an interrupt from Queue 3. To reset this bit, the application must read the MTL_Q3_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source.
2	0h RO/V	<b>Q2IS:</b> Queue 2 Interrupt status This bit indicates that there is an interrupt from Queue 2. To reset this bit, the application must read the MTL_Q2_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source.
1	0h RO/V	<b>Q1IS:</b> Queue 1 Interrupt status This bit indicates that there is an interrupt from Queue 1. To reset this bit, the application must read the MTL_Q1_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source.
0	0h RO/V	<b>Q0IS:</b> Queue 0 Interrupt status This bit indicates that there is an interrupt from Queue 0. To reset this bit, the application must read Queue 0 Interrupt Control and Status register to get the exact cause of the interrupt and clear its source.

#### 14.23.1.340MTL\_RXQ\_DMA\_MAP0 — Offset 50200C30h

The Receive Queue and DMA Channel Mapping 0 register is reserved in EQOS-CORE and EQOS-MTL configurations.

Type	Size	Offset	Default
MMIO	32 bit	50200C30h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	<b>Reserved</b>
28	0h RW	<b>Q3DDMACH:</b> Queue 3 Enabled for Dynamic (per packet) DMA Channel Selection When set, this bit indicates that the packets received in Queue 3 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 3 are routed to the DMA Channel programmed in the Q3MDMACH field (Bits[26:24]).
27	0h RO	<b>Reserved</b>
26:24	0h RW	<b>Q3MDMACH:</b> Queue 3 Mapped to DMA Channel This field controls the routing of the received packet in Queue 3 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q3DDMACH field is reset. Note: The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the others are reserved
23:21	0h RO	<b>Reserved</b>
20	0h RW	<b>Q2DDMACH:</b> Queue 2 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 2 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 2 are routed to the DMA Channel programmed in the Q2MDMACH field (Bits[18:16]).
19	0h RO	<b>Reserved</b>
18:16	0h RW	<b>Q2MDMACH:</b> Queue 2 Mapped to DMA Channel This field controls the routing of the received packet in Queue 2 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q2DDMACH field is reset.
15:13	0h RO	<b>Reserved</b>
12	0h RW	<b>Q1DDMACH:</b> Queue 1 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 1 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 1 are routed to the DMA Channel programmed in the Q1MDMACH field (Bits[10:8]).

Bit Range	Default & Access	Field Name (ID): Description
11	0h RO	<b>Reserved</b>
10:8	0h RW	<b>Q1MDMACH:</b> Queue 1 Mapped to DMA Channel This field controls the routing of the received packet in Queue 1 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q1DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7:5	0h RO	<b>Reserved</b>
4	0h RW	<b>Q0DDMACH:</b> Queue 0 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 0 are routed to the DMA Channel programmed in the Q0MDMACH field.
3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>Q0MDMACH:</b> Queue 0 Mapped to DMA Channel This field controls the routing of the packet received in Queue 0 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q0DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

#### 14.23.1.341MTL\_RXQ\_DMA\_MAP1 — Offset 50200C34h

The Receive Queue and DMA Channel Mapping 1 register is reserved in EQOS-CORE and EQOS-MTL configurations.

Type	Size	Offset	Default
MMIO	32 bit	50200C34h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	<b>Reserved</b>
28	0h RW	<b>Q7DDMACH:</b> Queue 7 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 7 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 7 are routed to the DMA Channel programmed in the Q7MDMACH field.
27	0h RO	<b>Reserved</b>
26:24	0h RW	<b>Q7MDMACH:</b> Queue 7 Mapped to DMA Channel This field controls the routing of the packet received in Queue 7 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q7DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
23:21	0h RO	<b>Reserved</b>
20	0h RW	<b>Q6DDMACH:</b> Queue 6 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 6 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 6 are routed to the DMA Channel programmed in the Q6MDMACH field.
19	0h RO	<b>Reserved</b>
18:16	0h RW	<b>Q6MDMACH:</b> Queue 6 Mapped to DMA Channel This field controls the routing of the packet received in Queue 6 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q6DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
15:13	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	<b>Q5DDMACH:</b> Queue 5 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 5 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 5 are routed to the DMA Channel programmed in the Q5MDMACH field.
11	0h RO	<b>Reserved</b>
10:8	0h RW	<b>Q5MDMACH:</b> Queue 5 Mapped to DMA Channel This field controls the routing of the packets received in Queue 5 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q5DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7:5	0h RO	<b>Reserved</b>
4	0h RW	<b>Q4DDMACH:</b> Queue 4 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 4 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 4 are routed to the DMA Channel programmed in the Q4MDMACH field.
3	0h RO	<b>Reserved</b>
2:0	0h RW	<b>Q4MDMACH:</b> Queue 4 Mapped to DMA Channel This field controls the routing of the packet received in Queue 4 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q4DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

#### 14.23.1.342MTL\_TBS\_CTRL — Offset 50200C40h

This register controls the operation of Time Based Scheduling.

Type	Size	Offset	Default
MMIO	32 bit	50200C40h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000h RW	<b>LEOS:</b> Launch Expiry Offset The value in units of 256 nanoseconds that has to be added to the Launch time to compute the Launch Expiry time. Value valid only when LEOV is set. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7	0h RO	<b>Reserved</b>
6:4	0h RW	<b>LEGOS:</b> Launch Expiry GSN Offset The number GSN slots that has to be added to the Launch GSN to compute the Launch Expiry time. Value valid only when LEOV is set.
3:2	0h RO	<b>Reserved</b>
1	0h RW	<b>LEOV:</b> Launch Expiry Offset Valid When set indicates the LEOS field is valid. When not set, indicates the Launch Expiry Offset is not valid and the MTL must not check for Launch expiry time.
0	0h RW	<b>ESTM:</b> EST offset Mode When this bit is set, the Launch Time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the Base Time Register (BTR) of the current list. When reset, the Launch Time value is used as an absolute value that should be compared with the System time [39:8].

#### 14.23.1.343MTL\_EST\_CONTROL — Offset 50200C50h

This register controls the operation of Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Type	Size	Offset	Default
MMIO	32 bit	50200C50h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RW	<b>PTOV:</b> PTP Time Offset Value The value of PTP Clock period multiplied by 6 in nanoseconds. This value is needed to avoid transmission overruns at the beginning of the installation of a new GCL.
23:12	000h RW	<b>CTOV:</b> Current Time Offset Value Provides a 12 bit time offset value in nano second that is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays etc. This offset helps to ensure that the impact of gate controls is visible on the line exactly at the pre-determined schedule (or as close to the schedule as possible).
11	0h RO	<b>Reserved</b>
10:8	0h RW	<b>TILS:</b> Time Interval Left Shift Amount This field provides the left shift amount for the programmed Time Interval values used in the Gate Control Lists. - 000: No left shift needed (equal to x1ns) - 001: Left shift TI by 1 bit (equal to x2ns) - 010: Left shift TI by 2 bits (equal to x4ns) - . . . - 100: Left shift TI by 7 bits (equal to x128ns) Based on the configuration one or more bits of this field should be treated as Reserved/ Read-Only.
7:6	0h RW	<b>LCSE:</b> Loop Count to report Scheduling Error Programmable number of GCL list iterations before reporting an HLBS error defined in EST_Status register.
5	0h RW	<b>DFBS:</b> Drop Frames causing Scheduling Error When set frames reported to cause HOL Blocking due to not getting scheduled (HLBS field of EST_Status register) after 4,8,16,32 (based on LCSE field of this register) GCL iterations are dropped.
4	0h RW	<b>DDBF:</b> Do not Drop frames during Frame Size Error When set, frames are not be dropped during Head-of-Line blocking due to Frame Size Error (HLBF field of EST_Status register).

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	<b>Reserved</b>
1	0h RW	<b>SSWL:</b> Switch to S/W owned list When set indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Hardware clears this bit when the switch to the SWOL happens to indicate the completion of the switch or when an BTR error (BTRE in Status register) is set. When BTRE is set this bit is cleared but SWOL is not updated as the switch was not successful. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.
0	0h RW	<b>EEST:</b> Enable EST When reset, the gate control list processing is halted and all gates are assumed to be in Open state. Should be set for the hardware to start processing the gate control lists. During the toggle from 0 to 1, the gate control list processing starts only after the SSWL bit is set. When DWC_EQOS_ASP_ECC is selected during the configuration, if any uncorrectable error is detected in the EST memory the hardware resets this bit and disables the EST function.

#### 14.23.1.344 MTL\_EST\_STATUS – Offset 50200C58h

This register provides Status related to Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Type	Size	Offset	Default
MMIO	32 bit	50200C58h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19:16	0h RO/V	<b>CGSN:</b> Current GCL Slot Number Indicates the slot number of the GCL list. Slot number is a modulo 16 count of the GCL List loops executed so far. Even if a new GCL list is installed, the count is incremental.
15:8	00h RO/V	<b>BTRL:</b> BTR Error Loop Count Provides the minimum count (N) for which the equation Current Time = < New BTR + (N * New Cycle Time) becomes true. N = "11111111" indicates the iterations exceeded the value of 128 and the hardware was not able to update New BTR to be equal to or greater than Current Time. Software intervention is needed to update the New BTR. Value cleared when BTRE field of this register is cleared.
7	0h RO/V	<b>SWOL:</b> S/W owned list When '0' indicates Gate control list number "0" is owned by software and when '1' indicates the Gate Control list "1" is owned by the software. Any reads/writes by the software (using indirect access via GCL_Control) is directed to the list indicated by this value by default. The inverse of this value is treated as HWOL. R/W operations performed by hardware are directed to the list pointed by HWOL by default.

Bit Range	Default & Access	Field Name (ID): Description
6:5	0h RO	<b>Reserved</b>
4	0h RW	<b>CGCE:</b> Constant Gate Control Error This error occurs when the list length (LLR) is 1 and the Cycle Time (CTR) is less than or equal to the programmed Time Interval (TI) value after the optional Left Shifting. The above programming implies Gates are either always Closed or always Open based on the Gate Control values; the same effect can be achieved by other simpler (non TSN) programming mechanisms. Since the implementation does not support such a programming an error is reported. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.
3	0h RO/V	<b>HLBS:</b> Head-Of-Line Blocking due to Scheduling Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Indicates to software a potential programming error. The one hot encoded values of the Queue Numbers that are not able to make progress are indicated in the MTL_EST_Sch_Error register. Bit cleared when MTL_EST_Sch_Error register is all zeros.
2	0h RO/V	<b>HLBF:</b> Head-Of-Line Blocking due to Frame Size Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. The one hot encoded Queue numbers that are experiencing HLBF are indicated in the MTL_EST_Frm_Size_Error register. Additionally, the first Queue number that experienced HLBF along with the frame size is captured in MTL_EST_Frm_Size_Capture register. Bit cleared when MTL_EST_Frame_Size_Error register is all zeros.
1	0h RW	<b>BTRE:</b> BTR Error When "1" indicates a programming error in the BTR of SWOL where the programmed value is less than current time. If the BTRL = "1111111", SWOL is not updated and Software should reprogram the BTR to a value greater than current time and then set SSWL to reinitiate the switch to SWOL. Else if the value of BTRL < "1111111", SWOL is updated and this field indicates the number of iterations (of + CycleTime) taken by hardware to update the BTR to a value greater than Current Time. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.
0	0h RW	<b>SWLC:</b> Switch to S/W owned list Complete When "1" indicates the hardware has successfully switched to the SWOL, and the SWOL bit has been updated to that effect. Cleared when the SSWL of EST_Control register transitions from 0 to 1, or on a software write. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

#### 14.23.1.345 MTL\_EST\_SCH\_ERROR – Offset 50200C60h

This register provides the One Hot encoded Queue Numbers that are having the Scheduling related error (timeout).

Type	Size	Offset	Default
MMIO	32 bit	50200C60h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>SEQN:</b> Schedule Error Queue Number The One Hot Encoded Queue Numbers that have experienced error/timeout described in HLBS field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

#### 14.23.1.346MTL\_EST\_FRM\_SIZE\_ERROR — Offset 50200C64h

This register provides the One Hot encoded Queue Numbers that are having the Frame Size related error.

Type	Size	Offset	Default
MMIO	32 bit	50200C64h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	<b>Reserved</b>
7:0	00h RW	<b>FEQN:</b> Frame Size Error Queue Number The One Hot Encoded Queue Numbers that have experienced error described in HLBF field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

#### 14.23.1.347MTL\_EST\_FRM\_SIZE\_CAPTURE — Offset 50200C68h

This register captures the Frame Size and Queue Number of the first occurrence of the Frame Size related error. Up on clearing it captures the data of immediate next occurrence of a similar error.

Type	Size	Offset	Default
MMIO	32 bit	50200C68h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	<b>Reserved</b>
18:16	0h RO/V	<b>HBFQ:</b> Queue Number of HLFQ Captures the binary value of the first Queue (number) experiencing HLFQ error (see HLFQ field of status register). Value once written is not altered by any subsequent queue errors of similar nature. Once cleared the queue number of the next occurring HLFQ error is captured. Width is based on the number of Tx Queues configured; remaining bits are Read-Only. Cleared when MTL_EST_Frm_Size_Error register is all zeros.
15	0h RO	<b>Reserved</b>
14:0	0000h RO/V	<b>HBFS:</b> Frame Size of HLFQ Captures the Frame Size of the dropped frame related to queue number indicated in HBFQ field of this register. Contents of this register should be considered invalid, if this field is zero. Cleared when MTL_EST_Frm_Size_Error register is all zeros.

#### 14.23.1.348MTL\_EST\_INTR\_ENABLE – Offset 50200C70h

This register implements the Interrupt Enable bits for the various events that generate an interrupt. Bit positions have a 1 to 1 correlation with the status bit positions in MTL\_ETS\_Status register.

Type	Size	Offset	Default
MMIO	32 bit	50200C70h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	<b>Reserved</b>
4	0h RW	<b>CGCE:</b> Interrupt Enable for CGCE When set, generates interrupt when the Constant Gate Control Error occurs and is indicated in the status. When reset this event does not generate an interrupt
3	0h RW	<b>IEHS:</b> Interrupt Enable for HLBS When set, generates interrupt when the Head-of-Line Blocking due to Scheduling issue and is indicated in the status. When reset this event does not generate an interrupt.
2	0h RW	<b>IEHF:</b> Interrupt Enable for HLBF When set, generates interrupt when the Head-of-Line Blocking due to Frame Size error occurs and is indicated in the status. When reset this event does not generate an interrupt.
1	0h RW	<b>IEBE:</b> Interrupt Enable for BTR Error When set, generates interrupt when the BTR Error occurs and is indicated in the status. When reset this event does not generate an interrupt.
0	0h RW	<b>IECC:</b> Interrupt Enable for Switch List When set, generates interrupt when the configuration change is successful and the hardware has switched to the new list. When reset this event does not generate an interrupt.

#### 14.23.1.349MTL\_EST\_GCL\_CONTROL — Offset 50200C80h

This register provides the control information for reading/writing to the Gate Control lists.

Type	Size	Offset	Default
MMIO	32 bit	50200C80h	00000000h

## Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	<b>Reserved</b>
23:22	0h RW	<b>ESTEIEC:</b> ECC Inject Error Control for EST Memory When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field. This field is valid only if DWC_EQOS_ASP_ECC feature is selected during the configuration, else it is reserved.
21	0h RW	<b>ESTEIEE:</b> EST ECC Inject Error Enable When set along with EEST bit of MTL_EST_Control register, enables the ECC error injection feature. When reset, disables the ECC error injection feature.
20:17	0h RO	<b>Reserved</b>
16:8	000h RW	<b>ADDR:</b> Gate Control List Address: (GCLA when GCRR is "0"). Provides the address (row number) of the Gate Control List at which the R/W operation has to be performed. By default the Gate Control List pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. The width of this field is dependent on DWC_EQOS_EST_DEP; unused bits should be treated as read only. Gate Control list Related Registers Address: (GCRA when GCRR is "1"). By default the GCL related register set pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. Lower 3 bits are only used in this mode, higher order bits are treated as dont cares. - 000: BTR Low (31:0) - 001: BTR High (63:31) - 010: CTR Low (31:0) - 011: CTR High (39:32) - 100: TER (31:0) - 101: LLR (n:0) (where n is (log{DWC_EQOS_EST_DEP} / log2)) - Others: Reserved
7:6	0h RO	<b>Reserved</b>
5	0h RW	<b>DBG:</b> Debug Mode Bank Select When set to "0" indicates R/W in debug mode should be directed to Bank 0 (GCL0 and corresponding Time related registers). When set to "1" indicates R/W in debug mode should be directed to Bank 1 (GCL1 and corresponding Time related registers). This value is used when DBGM is set and overrides by value of SWOL which is normally used.
4	0h RW	<b>DBGM:</b> Debug Mode When set to "1" indicates R/W in debug mode where the memory bank (for GCL and Time related registers) is explicitly provided by DBG value, when set to "0" SWOL bit is used to determine which bank to use.
3	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	<b>GCRR:</b> Gate Control Related Registers When set to "1" indicates the R/W access is for the GCL related registers (BTR, CTR, TER, LLR) whose address is provided by GCRA. When "0" indicates R/W should be directed to GCL from the address provided by GCLA.
1	0h RW	<b>R1WO:</b> Read '1', Write '0': When set to '1': Read Operation When set to '0': Write Operation.
0	0h RW	<b>SRWO:</b> Start Read/Write Op When set indicates a Read/Write Op has started and is in progress. When reset by hardware indicates the R/W Op has completed or an error has occurred (when bit 20 is set) Reads: Data can be read from MTL_EST_GCL_Data register after this bit is reset Writes: MTL_EST_GCL_Data should be programmed with write data before setting SRWO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

#### 14.23.1.350MTL\_EST\_GCL\_DATA — Offset 50200C84h

This register holds the read data or write data in case of reads and writes respectively.

Type	Size	Offset	Default
MMIO	32 bit	50200C84h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	<b>GCD:</b> Gate Control Data The data corresponding to the address selected in the GCL_Control register. Used for both Read and Write operations.

#### 14.23.1.351MTL\_FPE\_CTRL\_STS — Offset 50200C90h

This register controls the operation of, and provides status for Frame Preemption (IEEE802.1Qbu/802.3br).

Type	Size	Offset	Default
MMIO	32 bit	50200C90h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	<b>Reserved</b>
28	0h RO/V	<b>HRS:</b> Hold/Release Status - 1: Indicates a Set-and-Hold-MAC operation was last executed and the pMAC is in Hold State. - 0: Indicates a Set-and-Release-MAC operation was last executed and the pMAC is in Release State.
27:16	0h RO	<b>Reserved</b>
15:8	00h RW	<b>PEC:</b> Preemption Classification When set indicates the corresponding Queue must be classified as preemptable, when '0' Queue is classified as express. When both EST (Qbv) and Preemption are enabled, Queue-0 is always assumed to be preemptable. When EST (Qbv) is enabled Queues categorized as preemptable here are always assumed to be in "Open" state in the Gate Control List.
7:2	0h RO	<b>Reserved</b>
1:0	0h RW	<b>AFSZ:</b> Additional Fragment Size used to indicate, in units of 64 bytes, the minimum number of bytes over 64 bytes required in non-final fragments of preempted frames. The minimum non-final fragment size is (AFSZ +1) * 64 bytes

#### 14.23.1.352MTL\_FPE\_ADVANCE — Offset 50200C94h

This register holds the Hold and Release Advance time.

Type	Size	Offset	Default
MMIO	32 bit	50200C94h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	<b>RADV:</b> Release Advance The maximum time in nanoseconds that can elapse between issuing a RELEASE to the MAC and the MAC being ready to resume transmission of preemptable frames, in the absence of there being any express frames available for transmission.
15:0	0000h RW	<b>HADV:</b> Hold Advance The maximum time in nanoseconds that can elapse between issuing a HOLD to the MAC and the MAC ceasing to transmit any preemptable frame that is in the process of transmission or any preemptable frames that are queued for transmission.

#### 14.23.1.353MTL\_RXP\_CONTROL\_STATUS – Offset 50200CA0h

The MTL\_RXP\_Control\_Status register establishes the operating mode of Rx Parser and provides some status.

Type	Size	Offset	Default
MMIO	32 bit	50200CA0h	80FF00FFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO/V	<b>RXPI:</b> RX Parser in Idle state This status bit is set to 1 when the Rx parser is in Idle State and waiting for a new packet for processing. This bit is used as a handshake with software when parser gets disabled. After disabling, when bit is set then software can update the Rx parser instruction table.
30:24	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
23:16	FFh RW	<b>NPE:</b> Number of parsable entries in the Instruction table This control indicates the number of parsable entries in the Instruction Memory. This is used in Rx parser logic to detect programming Error. In case number of parsed entries for a packet is more than this entry then NPEOVIS bit in the MTL_RXP_Interrupt_Control_Status register is set.
15:8	0h RO	<b>Reserved</b>
7:0	FFh RW	<b>NVE:</b> Number of valid entry address/index in the Instruction table This control indicates the number of valid entries address/index in the Instruction Memory (i.e. when NVE field in register=31, the maximum valid entry address is NVE+1 i.e. addresses/indices=0 to 32, or 33 entries). This is used in Rx parser logic to detect any programming Error. In case while parsing Table address (memory address) found to be more than this maximum valid entry address then NVEOVIS bit in the MTL_RXP_Interrupt_Control_Status register is set. Note: The minimum value of this should be 2.

#### 14.23.1.354MTL\_RXP\_INTERRUPT\_CONTROL\_STATUS – Offset 50200CA4h

The MTL\_RXP\_Interrupt\_Control\_Status registers provides enable control for the interrupts and provides interrupt status.

Type	Size	Offset	Default
MMIO	32 bit	50200CA4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>
19	0h RW	<b>PDRFIE:</b> Packet Drop due to RF Interrupt Enable When this bit is set, the PDRFIS interrupt is enabled. When this bit is reset, the PDRFIS interrupt is disabled.
18	0h RW	<b>FOOVIE:</b> Frame Offset Overflow Interrupt Enable When this bit is set, the FOOVIS interrupt is enabled. When this bit is reset, the FOOVIS interrupt is disabled.
17	0h RW	<b>NPEOVIE:</b> Number of Parsable Entries Overflow Interrupt Enable When this bit is set, the NPEOVIS interrupt is enabled. When this bit is reset, the NPEOVIS interrupt is disabled.
16	0h RW	<b>NVEOVIE:</b> Number of Valid Entries Overflow Interrupt Enable When this bit is set, the NVEOVIS interrupt is enabled. When this bit is reset, the NVEOVIS interrupt is disabled.
15:4	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	<b>PDRFIS:</b> Packet Dropped due to RF Interrupt Status If the Rx Parser result says to drop the packet by setting RF=1 in the instruction memory, then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.
2	0h RW	<b>FOOVIS:</b> Frame Offset Overflow Interrupt Status While parsing if the Instruction table entry's 'Frame Offset' found to be more than EOF offset, then this bit is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.
1	0h RW	<b>NPEOVIS:</b> Number of Parsable Entries Overflow Interrupt Status While parsing a packet if the number of parsed entries found to be more than NPE[] (Number of Parseable Entries in MTL_RXP_Control register), then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.
0	0h RW	<b>NVEOVIS:</b> Number of Valid Entry Address/Index Overflow Interrupt Status While parsing if the Instruction address found to be more than NVE (Number of Valid Entry Address/index in MTL_RXP_Control register), then this bit is set to 1. For example, when NVE field in register=31, the maximum valid entry address/index is NVE+1 i.e. 32 (addresses/ indices=0 to 32, or 33 entries), so NVEOVIS is set when currently processed entry indicates next address is 33 or more i.e. 34th or later entries. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

#### 14.23.1.355 MTL\_RXP\_DROP\_CNT — Offset 50200CA8h

The MTL\_RXP\_Drop\_Cnt register provides the drop count of Rx Parser initiated drops.

Type	Size	Offset	Default
MMIO	32 bit	50200CA8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	<b>RXPDCOVF:</b> Rx Parser Drop Counter Overflow Bit When set, this bit indicates that the MTL_RXP_Drop_Cnt (RXPDC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event.
30:0	00000000h RO/V	<b>RXPDC:</b> Rx Parser Drop count This 31-bit counter is implemented whenever a Rx Parser Drops a packet due to RF = 1. The counter is cleared when the register is read.

#### 14.23.1.356 MTL\_RXP\_ERROR\_CNT — Offset 50200CACH

The MTL\_RXP\_Error\_Cnt register provides the Rx Parser related error occurrence count.

Type	Size	Offset	Default
MMIO	32 bit	50200CACH	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	<b>RXPECOVF:</b> Rx Parser Error Counter Overflow Bit When set, this bit indicates that the MTL_RXP_Error_cnt (RXPEC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event.
30:0	00000000h RO/V	<b>RXPEC:</b> Rx Parser Error count This 31-bit counter is implemented whenever a Rx Parser encounters following Error scenarios - Entry address >= NVE[] - Number Parsed Entries >= NPE[] - Entry address > EOF data entry address The counter is cleared when the register is read.

#### 14.23.1.357 MTL\_RXP\_INDIRECT\_ACC\_CONTROL\_STATUS – Offset 50200CB0h

The MTL\_RXP\_Indirect\_Acc\_Control\_Status register provides the Indirect Access control and status for Rx Parser memory.

Type	Size	Offset	Default
MMIO	32 bit	50200CB0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	<b>STARTBUSY:</b> FRP Instruction Table Access Busy When this bit is set to 1 by the software then it indicates to start the Read/Write operation from/to the Rx Parser Memory. Software should read this bit as 0 before issuing read or write request to access the Parser Memory Instructions. This bit when set to 1 indicates that hardware is busy until its gets cleared by hardware and software should not issue any read or write operation.
30:23	0h RO	<b>Reserved</b>
22:21	0h RW	<b>RXPIEC:</b> ECC Inject Error Control for Rx Parser Memory When EIEE bit of this register is set, following are the errors inserted based on the value encoded in this field.
20	0h RW	<b>RXPIEEE:</b> ECC Inject Error Enable for Rx Parser Memory When set, enables the ECC error injection feature. When reset, disables the ECC error injection feature.

Bit Range	Default & Access	Field Name (ID): Description
19:17	0h RO	<b>Reserved</b>
16	0h RW	<b>WRRDN:</b> Read Write Control When this bit is set to 1 indicates the write operation to the Rx Parser Memory. When this bit is set to 0 indicates the read operation to the Rx Parser Memory.
15:10	0h RO	<b>Reserved</b>
9:0	000h RW	<b>ADDR:</b> FRP Instruction Table Offset Address This field indicates the ADDR of the 32-bit entry in Rx parser instruction table. Each entry has 128-bit (4x32-bit words). The X depends on the configurable DWC_EQOS_FRP_ENTRIES If DWC_EQOS_FRP_ENTRIES == 256 , then X = 9 If DWC_EQOS_FRP_ENTRIES = 128 , then X = 8 If DWC_EQOS_FRP_ENTRIES = 64, then X = 7

#### 14.23.1.358 MTL\_RXP\_INDIRECT\_ACC\_DATA — Offset 50200CB4h

The MTL\_RXP\_Indirect\_Acc\_Data registers holds the data associated to Indirect Access to Rx Parser memory.

Type	Size	Offset	Default
MMIO	32 bit	50200CB4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO/V	<b>DATA:</b> FRP Instruction Table Write/Read Data Software should write this register before issuing any write command. The hardware provides the read data from the Rx Parser Memory for read operation when STARTBUSY =0 after read command.

#### 14.23.1.359 MTL\_ECC\_CONTROL — Offset 50200CC0h

The MTL\_ECC\_Control register establishes the operating mode of ECC related to MTL memories.

Type	Size	Offset	Default
MMIO	32 bit	50200CC0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	<b>Reserved</b>
8	0h RW	<b>MEEAO:</b> MTL ECC Error Address Status Over-ride When set, the following error address fields hold the last valid address where the error is detected. When reset, the following error address fields hold the first address where the error is detected. EUIAS/ECEAS of MTL_ECC_Err_Addr_Status register.
7:5	0h RO	<b>Reserved</b>
4	0h RW	<b>TSOEE:</b> TSO memory ECC Enable When set to 1, enables the ECC feature for TSO memory in DMA. When set to zero, disables the ECC feature for TSO memory in DMA.
3	0h RW	<b>MRXPEE:</b> MTL Rx Parser ECC Enable When set to 1, enables the ECC feature for Rx Parser memory. When set to zero, disables the ECC feature for Rx Parser memory.
2	0h RW	<b>MESTEE:</b> MTL EST ECC Enable When set to 1, enables the ECC feature for EST memory. When set to zero, disables the ECC feature for EST memory.
1	0h RW	<b>MRXEE:</b> MTL Rx FIFO ECC Enable When set to 1, enables the ECC feature for MTL Rx FIFO memory. When set to zero, disables the ECC feature for MTL Rx FIFO memory.
0	0h RW	<b>MTXEE:</b> MTL Tx FIFO ECC Enable When set to 1, enables the ECC feature for MTL Tx FIFO memory. When set to zero, disables the ECC feature for MTL Tx FIFO memory.

#### 14.23.1.360 MTL\_SAFETY\_INTERRUPT\_STATUS – Offset 50200CC4h

The MTL\_Safety\_Interrupt\_Status registers provides Safety interrupt status.

Type	Size	Offset	Default
MMIO	32 bit	50200CC4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	<b>Reserved</b>
1	0h RO/V	<b>MEUIS:</b> MTL ECC Uncorrectable error Interrupt Status This bit indicates that an uncorrectable error interrupt event in the MTL ECC safety feature. To get the exact cause of the interrupt the application should read the MTL_ECC_Interrupt_Status register.
0	0h RO/V	<b>MECIS:</b> MTL ECC Correctable error Interrupt Status This bit indicates that a correctable error interrupt event in the MTL ECC safety feature. To get the exact cause of the interrupt the application should read the MTL_ECC_Interrupt_Status register.

#### 14.23.1.361 MTL\_ECC\_INTERRUPT\_ENABLE — Offset 50200CC8h

The MTL\_ECC\_Interrupt\_Enable register provides enable bits for the ECC interrupts.

Type	Size	Offset	Default
MMIO	32 bit	50200CC8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	<b>Reserved</b>
12	0h RW	<b>RPCEIE:</b> Rx Parser memory Correctable Error Interrupt Enable When set, generates an interrupt when an uncorrectable error is detected at the Rx Parser memory interface. It is indicated in RPCES status bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt.
11:9	0h RO	<b>Reserved</b>
8	0h RW	<b>ECEIE:</b> EST memory Correctable Error Interrupt Enable When set, generates an interrupt when a correctable error is detected at the MTL EST memory interface. It is indicated in the ECES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt.

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	<b>Reserved</b>
4	0h RW	<b>RXCEIE:</b> Rx memory Correctable Error Interrupt Enable When set, generates an interrupt when a correctable error is detected at the MTL Rx memory interface. It is indicated in the RXCES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generate an interrupt.
3:1	0h RO	<b>Reserved</b>
0	0h RW	<b>TXCEIE:</b> Tx memory Correctable Error Interrupt Enable When set, generates an interrupt when a correctable error is detected at the MTL Tx memory interface. It is indicated in the TXCES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generate an interrupt.

#### 14.23.1.362 MTL\_ECC\_INTERRUPT\_STATUS — Offset 50200CCCh

The MTL\_ECC\_Interrupt\_Status register provides MTL ECC Interrupt Status.

Type	Size	Offset	Default
MMIO	32 bit	50200CCCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	<b>Reserved</b>
14	0h RW	<b>RPUES:</b> Rx Parser memory Uncorrectable Error Status When set, indicates that an uncorrectable error is detected at Rx Parser memory interface.
13	0h RW	<b>RPAMS:</b> MTL Rx Parser memory Address Mismatch Status This bit when set indicates that address mismatch is found for address bus of Rx Parser memory.
12	0h RW	<b>RPCES:</b> MTL Rx Parser memory Correctable Error Status This bit when set indicates that correctable error is detected at RX Parser memory interface.
11	0h RO	<b>Reserved</b>
10	0h RW	<b>EUES:</b> MTL EST memory Uncorrectable Error Status When set, indicates that an uncorrectable error is detected at MTL EST memory interface.
9	0h RW	<b>EAMS:</b> MTL EST memory Address Mismatch Status This bit when set indicates that address mismatch is found for address bus of MTL EST memory.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	<b>ECES:</b> MTL EST memory Correctable Error Status This bit when set indicates that correctable error is detected at the MTL EST memory.
7	0h RO	<b>Reserved</b>
6	0h RW	<b>RXUES:</b> MTL Rx memory Uncorrectable Error Status When set, indicates that an uncorrectable error is detected at the MTL Rx memory interface.
5	0h RW	<b>RXAMS:</b> MTL Rx memory Address Mismatch Status This bit when set indicates that address mismatch is found for address bus of the MTL Rx memory.
4	0h RW	<b>RXCES:</b> MTL Rx memory Correctable Error Status This bit when set indicates that correctable error is detected at the MTL Rx memory.
3	0h RO	<b>Reserved</b>
2	0h RW	<b>TXUES:</b> MTL Tx memory Uncorrectable Error Status When set, indicates that an uncorrectable error is detected at the MTL TX memory interface.
1	0h RW	<b>TXAMS:</b> MTL Tx memory Address Mismatch Status This bit when set indicates that address mismatch is found for address bus of the MTL Tx memory.
0	0h RW	<b>TXCES:</b> MTL Tx memory Correctable Error Status This bit when set indicates that a correctable error is detected at the MTL Tx memory.

#### 14.23.1.363MTL\_ECC\_ERR\_STS\_RCTL — Offset 50200CD0h

The MTL\_ECC\_Err\_Sts\_Rctl register establishes the control for ECC Error status capture.

Type	Size	Offset	Default
MMIO	32 bit	50200CD0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	<b>Reserved</b>
5	0h RW	<b>CUES:</b> Clear Uncorrectable Error Status When this bit is set along with EESRE bit of this register, based on the EMS field of this register, the respective memory's uncorrectable error address and uncorrectable error count values are cleared upon reading. Hardware resets this bit when all the error status values are cleared.
4	0h RW	<b>CCES:</b> Clear Correctable Error Status When this bit is set along with EESRE bit of this register, based on the EMS field of this register, the respective memory's correctable error address and correctable error count values are cleared upon reading. Hardware resets this bit when all the error status values are cleared.
3:1	0h RW	<b>EMS:</b> MTL ECC Memory Selection When EESRE bit of this register is set, this field indicates which memory's error status value to be read. The memory selection encoding is as described below.
0	0h RW	<b>EESRE:</b> MTL ECC Error Status Read Enable When this bit is set, based on the EMS field of this register, the respective memory's error status values are captured as described: - The correctable and uncorrectable error count values are captured into MTL_ECC_Err_Cnt_Status register - The address location's of correctable and uncorrectable errors are captured into MTL_ECC_Err_Addr_Status register. Hardware resets this bit when all the status values are captured into the MTL_ECC_Err_Cnt_Status and MTL_ECC_Err_Addr_Status registers.

#### 14.23.1.364MTL\_ECC\_ERR\_ADDR\_STATUS – Offset 50200CD4h

The MTL\_ECC\_Error\_Status register provides the memory addresses for the correctable and uncorrectable errors.

Type	Size	Offset	Default
MMIO	32 bit	50200CD4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO/V	<b>EUEAS:</b> MTL ECC Uncorrectable Error Address Status Based on the EMS field of MTL_ECC_Err_Sts_Rctl register, this field holds the respective memory's address locations for which an uncorrectable error or address mismatch is detected. When MEEAO bit of MTL_ECC_Control register is set, this field holds the last valid address of memory for which either an uncorrectable error or an address mismatch is detected. When MEEAO bit of MTL_ECC_Control register is reset, this field holds the first address of the memory for which either an uncorrectable error or address mismatch is detected.
15:0	0000h RO/V	<b>ECEAS:</b> MTL ECC Correctable Error Address Status Based on the EMS field of MTL_ECC_Err_Sts_Rctl register, this field holds the respective memory's address locations for which a correctable error is detected. When MEEAO bit of MTL_ECC_Control register is set, this field holds the last valid address of memory for which correctable error or address mismatch is detected. When MEEAO bit of MTL_ECC_Control register is reset, this field holds the first address of the memory for which correctable error is detected.

#### **14.23.1.365MTL\_ECC\_ERR\_CNTR\_STATUS – Offset 50200CD8h**

The MTL\_ECC\_Err\_Cntr\_Status register provides ECC Error count for Correctable and uncorrectable errors.

Type	Size	Offset	Default
MMIO	32 bit	50200CD8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	<b>Reserved</b>

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RO/V	<b>EUECS:</b> MTL ECC Uncorrectable Error Counter Status Based on the EMS field of MTL_ECC_Err_Cntr_Rctl register, this field holds the respective memory's uncorrectable error count value.
15:8	0h RO	<b>Reserved</b>
7:0	00h RO/V	<b>ECECS:</b> MTL ECC Correctable Error Counter Status Based on the EMS field of MTL_ECC_Err_Cntr_Rctl register, this field holds the respective memory's correctable error count value.

#### 14.23.1.366 MTL\_DPP\_CONTROL – Offset 50200CE0h

The MTL\_DPP\_Control establishes the operating mode of Data Parity protection and error injection.

Type	Size	Offset	Default
MMIO	32 bit	50200CE0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	<b>Reserved</b>
11	0h RW	<b>IPERD:</b> Insert Parity error in Rx write-back Descriptor parity generator When set to 1, parity bit of first valid data generated by the DMA Rx write-back descriptor parity generator(or at PG8 as shown in Receive data path parity protection diagram) is flipped.
10	0h RW	<b>IPETD:</b> Insert Parity error in Tx write-back Descriptor parity generator When set to 1, parity bit of first valid data generated by the DMA Tx write-back descriptor parity generator(or at PG4 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped.
9	0h RW	<b>IPETSO:</b> Insert Parity Error in DMA TSO parity generator When set to 1, parity bit of first valid data generated by the DMA TSO parity generator is (or at PG3 as shown in Transmit data path parity protection diagram) flipped. Hardware clears this bit once respective parity bit is flipped.
8	0h RW	<b>IPEDDC:</b> Insert Parity Error in DMA DTX Control word parity generator When set to 1, parity bit of first valid data generated by the DMA DTX Control word parity generator (or at PG2 as shown in Transmit data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	<b>IPEMRF:</b> Insert Parity Error in MTL Rx FIFO read control parity generator When set to 1, parity bit of first valid data generated by the MTL Rx FIFO read control parity generator (or at PG7 as shown in Receive data path parity protection diagram) is flipped. Hardware clears this bit once respective parity bit is flipped.
